>German radio. Is this compatible or do I need something else?

The concept is similar, but the data format is different. You
might be able to adapt some of the code, but it won't work as-is.

Both transmit one pulse per second, with the length of the
pulse signifying '0' or '1'. At the end of the minute you have a
string of bits that tell you the time and date at the end of the
minute. You can get the data format by writing to:

NIST/Radio Station WWV
2000 East County Road 58
Fort Collins, CO 80524-9499

Obviously the clock/receiver must convert the bitstream into
something a UART can understand. This may be raw data or it may
be converted into some more useful format; you'd have to ask
Heathkit.

In the case of WWV and WWVH (Hawaii), the pulses are sent on a
100-Hz subcarrier. The main carrier signal is in the shortwave
band, which means that propigation is subject to atmospheric
conditions. Broadcast power at WWV is 10Kw.

In the case of WWVB (60KHz) and DCF77 (77.5KHz), the carrier
is simply turned off and on once per second, there is no audio.
Since it is a 'longwave' signal, it propigates along the ground
and is not subject to atmospheric conditions. Broadcast power at
WWVB is 13Kw.

The data format for WWVB is different from both WWV and DCF77.
The cheapest receiver I've found for WWVB costs about $700, even
though it should be easier to receive and demodulate than WWV.

I've sent a letter to Heathkit, but I haven't received a reply
yet. I've heard that the clock is still being made-- how much
does it cost?

: I'd say the most likely reason is it uses a different microprocessor
: (6809) and would require rewriting probably from scratch.

TAPR use to offer a TNC-1 upgrade kit, which upgraded the TNC-1 into a TNC-2 system (Z80 and all). This would then be capable of running any TCN-2 firmware.

We stopped offering it several years ago, but seems like there might be interest in just bare boards with the instructions.

If this would help anyone - let me know and I'll see if I can get the TAPR board to spring for a limited board run for just bare boards as kit. There is nothing really hard to find on the board - would probably have to include the 1.1.8a firmware along with the set.

I would be interesting in getting input on this. If there is enough interest we might do something.

Cheers - Greg

>I have tried all kinds of port defintions and designations in the config
>file of the program to get the program to recognize the port and come alive.

Have you tried to follow the instructions in the manual section on
troubleshooting? There are many variations of circuits with just one
op-amp floating around. The problem is, that most of them where meant
for receive only. HamComm also transmits and has to pull the PTT and
FSK line. To keep the op-amp happy the HamComm interface has a bridge
rectifier made from 4 diodes. For a start, check the supply voltages at
the op-amp for correct polarity. Also make sure the op-amp output is
really connected to DSR.

>a very good reason why everyone else has gone to standard channels, and
>that reason is lessened mutual interference. Amateurs are being backward
>in refusing to acknowledge the advantages of channelization as a tool for
>interference control.

Wrong. Standard channelization is as old as the birth of broadcasting when it was realized that something had to be done to control the frequency allocations for the fledgling AM broadcast industry. It is the easy way out for narrow band VHF operations. Amateur operation on HF has been an example of how to share and conserve spectrum resources in an orderly fashion without channelization. As you pointed out just because your VFO has 10 Hz readout doesn't mean there are 10 Hz wide channels on HF for your use. But, if stations in QSO need to move 100 Hz to get away from a foreign broadcast carrier in region 2 then they can without worrying about changing channels.

We are taking a giant step backward by bringing something as ancient as channelization to the HF bands, only for a crutch for automated digital operation. This is particularly disappointing when the technology exists to provide a more robust and automated hunting system using dynamic channel centering. Unfortunately when channelization is implemented there will be no incentive to improve on it. So the first wrung of the system will be obsolete before it gets started.

Ray,

Likr all IP addresses, there are 4 bytes. all AMPR.ORG addresses are in net
44.0.0.0. Therefore, his address _could_ be 44.66.??? ie..anything!! In a
previous posting, the address coordinator for 44.066 was John DeGood NU3E
in Delaware. You can contact him. Maybe finger nu3e@ampr.org will return
something usefull.

Just a starting point, cause you dont have enough info to address a mail message!

[I tried sending this privately, but it bounced. It's good general advice on HC anyway...DM]

I'd recommend trying these steps to get your converter going:

1) Get the latest HamComm, 3.0, which is at oak.oakland.edu.

2) Try hooking up the box using the program's default com port selections as they come out of the archive; when trying lots of different configurations, it's easy to lose sight, and you need to start fresh every so often.

2A) Pay special attention to the com port addresses and IRQs; if these are incorrect, you'll get no output to the program.

3) Check the voltages to the 741, particularly the diode bridge. The HamComm 3.0 docs have a good section on troubleshooting.

3A) You may need to power the 741 externally; the HC 3.0 docs have a schematic for such modifications.

4) If the box is working correctly, you should see noise (random dots) on the scope (F8) display.

That being said, I have been using the same homebuilt decoder since HamComm 2.0, and I have not had a problem. The only change I will make to my box is to put a TL071 op-amp, which is considerably more sensitive than the 741.

Additionally, the ampr.org domain is not well connected to internet, and it
is not contigiously connected itself. So unless there is an amprnet to
internet gateway properly configured and operating near the destination
station, the mail will probably be bounced back to you. A simple way to see
if a path exists to the station in question is to try doing a telnet to his
domain name or ip address. If it results in a login prompt, then you should
also be able to send mail to the same address. The only other gotcha is
that some gateway operators restrict which services pass through their
gateway, to avoid hearing from FCC...

Not unless someone does a special version for it. AEA TNCs are >not< TNC2 clones. I don't even think the special version of NET/ROM that was done for the PK-88 will work in the PK-96, because of the new dual-modem hardware.

Think about this for just a moment. You want to take back characters
AFTER they have been sent to the other end?? "WORDOUT" does not
provide that capability, just the ability to retype WITHIN a word.
Once you hit the space bar that word is unalterable and in AMTOR it is
probably already being sent. I know it's gone in my station, because I
type at about 1/4 the speed that AMTOR can send!

From: rmorris@utkvx.utk.edu
Message-ID: <22JUL199413231931@utkvx.utk.edu>
Source record: 48207

I am interested in purchasing a Kantronics KPC-3. I am new to Packet so I am looking for something that is easy to setup and get going, yet will last me for a while. I will be using it with an older PC and a Yaesu 5W handheld. What are your thoughts on this piece of equipment? Will it support both HF and VHF operation? At a later date, I might be interested in doing some HF packet and would like to know if the KPC-3 will allow this?

Thanks in advance...

2418. Moonbounce

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-22 18:16:57 UTC
From: laplante@unirsvl.rsvl.unisys.com
Message-ID: <CtCtGA.I1r@unirsvl.rsvl.unisys.com>
Source record: 48216
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space

Has anyone played around with using RTTY for moonbounce? I understand that standard RTTY requires even better s/n ratios than SSB, which doesn't bode well for sucessful EME, but since the standard shift is only 170Hz it seems that RTTY could be crammed into a much narrower band-width, which would help (although it would limit the baud rate!).

It seems that with a syncronous transmission (rather than sync on a character basis) combined with a BCC for error correction, and multiple transmissions of the same message might give a smart (read PC) recieving TTY a chance at successful decoding in spite of very marginal s/n conditions.

Any interest? Any hope?

ARRL 13th ANNUAL DIGITAL COMMUNICATIONS CONFERENCE AUGUST 19-21

Do you operate a Digital mode (maybe Pactor, Packet, GTOR or AMTOR) now?
Do you find it difficult to keep up with the latest Digital technology?
Would you like to know more about Digital modes?
If you answered "yes" to any of these questions, then you should attend the
13th Annual ARRL Digital Communications Conference. Read on ...

The Conference will be held on August 19 - 21, 1994 at the Thunderbird
Convention Center, 2201 East 78th Street in Bloomington, Minnesota.
Accomodations are available at the adjacent Thunderbird Hotel, at the many
Hotels and Motels located within a short distance, and also at several area
RV\camper campgrounds.

Enjoy a weekend of fun learning about the latest developments in TCP/IP,
PACTOR, AMTOR, PACTOR-II, CLOVER, G-TOR, PACKET, DSP, and imaging. Participate
in the nine forums about DSP, new HF modes, TCP/IP, VHF/UHF networking, BBS
SYSOP issues and more. A glance at the program (attached) will show many
forums that will catch your interest!

```
**************************************************************************
* *** NEWS FLASH *** *
* *
* BEGINNER'S FORUM ADDED TO FRIDAY CONFERENCE AGENDA *
* If you are a newcomer to Digital Communications and feel somewhat *
* intimidated by all of the technical "jargon", then the Friday Evening *
* Beginner's Forum is just the thing for you. Veteran instructor John *
* Kaplan, WR0W, will present a "crash" course from 7-9:30 PM to help you *
* feel more comfortable in the Saturday technical forums and discussions. *
* There is no extra cost for this forum - its included in the main *
* registration fee. Space is limited so register now! *
**************************************************************************
```

One of the highlights of the conference will be the presentation of 18
technical papers on the many aspects of digital communications throughout the
day on Saturday. A list of papers is attached. You will receive a copy of
all papers presented.

Many demonstrations of the latest in hardware and software will be presented.
When you leave, you will have an in-depth understanding of the latest digital
communications advancements and techniques. The Saturday evening Technical
Showcase will feature TAPR Special Interest Group meetings for BBS SYSOPs
and on VHF/UHF network building and a nearly-mathless presentation of the
design and implementation of DSP software for a high-performance HF DSP
modem based on the $99 TI DSK DSP evaluation module by Johan Forrer, KC7WW.

The Hospitality Room will provide the place to meet old friends ... and make new ones. At the Saturday luncheon you will get to know "who's who" in digital communications. Meet the Engineering staff of manufacturers like Kantronics and Timewave Technologies. The optional Saturday evening diner will provide another opportunity to make new friends.

If you want a break from the Conference, the Mall of America, with hundreds of unique stores, is located within easy walking distance. Your family will enjoy Knott's Camp Snoopy theme park inside the Mall. The renowned Minnesota Zoo is only a short drive away.

The Conference registration fee is $45 per person, which includes admission to all Conference activities, a luncheon buffet and a copy of the technical papers. An optional Saturday evening buffet is $20 per person additional. Registration deadline is August 12th.

Hmmm..... Ok, well to get near-DC response, you will need to modulate the reference oscillator as well, as you point out because the PLL will track the mod and quite effectively remove the LF component. This is a lot easier than it sounds but can be done with patience.

Firstly you'll need to plot the response curves and see where the acceptable point on the roll-off slope occurs and build a kind of cross-over network that will then feed the LF to a varicap across the reference crystal. You may well need some active filtering to get the LF response curve correct as you'll be combating the PLL, which becomes ever more efficient at tracking/removing the LF component as you decrease in frequency.

This is the point at which it gets tricky as you can only swing the reference oscillator by so much (you don't say what freq this is, 3.2, 6.4 etc).

Also, you should watch out for group/phase delays when doing this, as these can prove to be very problematic, especially at high data rates.

Cheers, Martin.

direct

Hi, I'm new to packet radio and have a few questions that were not answered specifically by the FAQ or other documents.

1: What are the maximum speeds attainable, in baud. I heard someone talking about microwave packets. Are these a reality? How fast are they?

2: Is it possible to get full access to the internet through packet, i.e. get to a unix shell
telnet> prompt or a direct tcp/ip connection? if not...

3: Is it possible to create a gateway to a standard telephone network, either directally or through you home phone, setting up trancievers on both ends, etc.

And Finally...

How?

Also, could people post the names of some good books on packet radio? They seem like an item
you must special-order at almost all bookstores.

Anyone having any Boston, MA specific info would be especially helpful.

Thanks in advancd, djbc<Daniel JB Clark>

2423. 9600 baud & MICOR HELP?

It is my understanding that the Micor takes about 4 Volts to activiate the VCO to 5khz deviation....The problem we have is the G3RUH modem output is about 80 mV....Have we openeed a can of worms ? We need help in interfacing the Micor with the G3RUH modem...Can anyone out there help us ???The network is for a 440 backbone going from CentralWyoming to Montana....any help would be appreciated....tnx KE7VS

2424. MSYS or BBS help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-23 08:13:49 UTC
From: brad@ecst.csuchico.edu
Message-ID: <30qjft$n13@charnel.ecst.CSUChico.EDU>
Source record: 48215

I am trying to establish a VIPBBS in my area and need some information regarding MSYS116 or ver 117. I have been trying to get the program to run on an old 386DX20 with 1 meg of memory. Not extended memory but a total of 1 meg of memory. I have printed out the docs and at one time it did run for acouple of days but locked up and crashed. I have greated the MSYS.OPT file and the MSYSFWD.DEF file. Also ran the mutil.exe and type number 9 for set up at the menu and after it completed I typed 'msys' to run the program but it comes up and says there is 0 extended memory and 0 blocks of memory also states it can not find the msys.do file which the instructions are very vague about on how to create that file. But after all this I get the cmd: prompt with the flashing cursor and it locks up ... does it everytime now.

My question is this, how much memory does it take to run this program

and would FBBS be better or do you know If I what BBS program can I run on a 386DX20 with only 1 meg of memory, one of each high density floppies and an 88 meg hd. The monitor or video output is CGA. Any help you can give me would be deeply appreciated. If FBBS would be a better program to run on this system I would also like to know where I may obtain a copy of that program. I also neglected to mention that I am using a Kantronics KPC-3 which is capable of Kiss mode.

>Well some say it does and others say it doesn't, I'm not sure. I've ran it on a 286, but now run it on a 386-40, and no probs. I have done some MODs to the
>source driver and it seems to uses less CPU and hog less of the system.
>Now if it works on a XT I have no idea, hard to find those machines any more. :)

I used for some time a Baycomm modem with an IBM Portable (one of the earlier IBM laptops) which is functionally a XT.

The operation is very marginal, Baycomm 1.4 works better than 1.5 which have a trend to bomb out (stack overflow and the like), TFPCX (the WA8DED generic host driver for Baycomms) just hangs and AX25DRV (the KISS driver for Baycomms) doesn't hang but not receive anything either.

Even Baycomm 1.4 is unreliable, it just miss too many packets, and the retry rate is well above anything you might get with a normal TNC and what most persons would define as acceptable.

The very same device with a low end 386SX 16 Mhz work like a charm, I strongly suspect a 286 9 Mhz AT class would make the job too, but a 8088 4.7 Mhz is below the red line (or just on it).

I ended up with a KPC-3 in the very same machine that bring it back into packet life at a very reasonable cost.

2426. Re: MSYS or BBS help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-23 13:09:29 UTC
From: sww@csuohio.edu
Message-ID: <1994Jul23.130929.19567@news.csuohio.edu>
Source record: 48217

Hi ...
I run it on a HP100LX palmtop (a 186 with a 1m RAM disk). It runs
fine.
Probably the biggest problem with any BBS program is the need for
documentation. We ask for every BBS program to do every function and then
are surprized to see how complicated they are.
MSYS.DO is explained on page 160 with an example file given on
page 195.
First, check that MUTIL 5 will verify that you are talking to your
serial port. If it was running at one time, then it appears that this is
working. Try it anyway. You will need a loopback plug.
Now take EVERYTHING not absolutely necessary out of your AUTOEXEC.BAT
and CONFIG.SYS.
More likely than any of those is the fact that the full version of MSYS
is not really intended to be run on memory limited machines. A much better
option for you is the version called MSYSB.EXE. This is a version which does
not include the NODE or TCP/IP functions. You still have K-Node facilities
so the only loss is the TCP/IP. Pages 156 and 157 is dedicated to memory
management. The paragraph about number of message slots is appropriate.
73,
Steve
ag807@cleveland.freenet.edu
NO8M.#NEOH.OH.USA.NA

(The palmtop is used in my work enviroment (a car) to automatically get
and send my mail and weather net stuff. I run with 300 message slots and
all node/conference and other facilities enabled.)

2427. Filters for TI DSP Kit

Newsgroup: rec.radio.amateur.digital.misc

Hi Bryan,
I've been playing with unproto Pactor on Oscar 13. Pactor FEC has the
advantage that you can set the number of repeats to a max of 6 or 7 so
even though the throughput goes way down the message can still get
through uncorrupted. Amtor FEC would work too but not nearly as well.
Via EME would be quite a challenge but between two reasonably well
equipped stations it should do OK. I'll be on EME this winter but
my station will fall into the "marginal" category so I don't expect
to be working much ssb & rtty.
Good luck,
John - VE8EV

CALL FOR PARTICIPATION

WORKSHOP ON MOBILE COMPUTING SYSTEMS AND APPLICATIONS

DECEMBER 8-9 1994
DREAM INN, SANTA CRUZ, CA

Sponsored by the IEEE Computer Society TCOS
(in cooperation with ACM SIGOPS and USENIX Association)

General Chair Darrell Long, University of California, Santa Cruz

Program Chair M. Satyanarayanan, Carnegie Mellon University

Exhibits Peter Honeyman, University of Michigan

Finance & Registration
Richard Golding, Hewlett-Packard

Publication Luis-Felipe Cabrera, IBM Almaden

Program Committee
Dan Duchamp, Columbia University
Peter Honeyman, University of Michigan
Randy Katz, UC Berkeley & ARPA
Jay Kistler, DEC SRC
Krishan Sabnani, AT&T Holmdel
M. Satyanarayanan, Carnegie Mellon University
Amal Shaheen, IBM Austin
Marvin Theimer, Xerox PARC
Rich Wolff, Bellcore

A major challenge of this decade is the effective exploitation of two symbiotic technologies: portable computers and wireless networks. Harnessing these technologies will dramatically change the computing landscape. But realizing the full potential of the resulting mobile computing systems will require advances in many areas such as:

hardware communications scalability power management
security data access user interfaces location sensitivity

The goal of this workshop is to foster exchange of ideas in mobile computing among workers in the field. Attendance will be limited to about 60 participants, based on the position papers submitted. Submissions should be fewer than 5 pages in length and may expose a new problem, advocate a specific solution, or report on actual experience.

In addition, we will be hosting a small number of novel hardware and software exhibits relevant to mobile computing. The exhibits may be research prototypes or commercial products. Interested parties should submit technical descriptions of their exhibits.

Online copies of the position papers will be made available via anonymous FTP prior to the workshop. A printed proceedings will be published after the workshop, and mailed to participants.

A small number of graduate students will be granted a waiver of the registration fee. In return, these students will be required to take notes at the workshop and help put together the proceedings. Students who wish to be considered for the waiver must send in a brief description of their current research, and an explanation of how participation in the workshop is likely to help them.

Send 10 copies of position papers to:

M. Satyanarayanan Email: satya@cs.cmu.edu
School of Computer Science Phone: (412)-268-3743
Carnegie Mellon University Fax: (412)-681-5739
Pittsburgh, PA 15213

Send exhibit descriptions to:

Peter Honeyman Email: honey@citi.umich.edu
CITI Phone: (313)-763-4413
University of Michigan Fax: (313)-763-4434
Ann Arbor, MI 48103-4943

IMPORTANT DATES

Submissions due August 20 1994

Acceptance Notification October 1 1994

Camera-ready copy due November 15 1994

>From: ESTEY@SKYLER.MAVD.HONEYWELL.COM
Date: Fri, 22 Jul 1994 19:31:17 -0500 (CDT)

ARRL 13th ANNUAL DIGITAL COMMUNICATIONS CONFERENCE AUGUST 19-21

Do you operate a Digital mode (maybe Pactor, Packet, GTOR or AMTOR) now?
Do you find it difficult to keep up with the latest Digital technology?
Would you like to know more about Digital modes?
If you answered "yes" to any of these questions, then you should attend the
13th Annual ARRL Digital Communications Conference. Read on ...

The Conference will be held on August 19 - 21, 1994 at the Thunderbird
Convention Center, 2201 East 78th Street in Bloomington, Minnesota.
Accomodations are available at the adjacent Thunderbird Hotel, at the many
Hotels and Motels located within a short distance, and also at several area
RV\camper campgrounds.

Enjoy a weekend of fun learning about the latest developments in TCP/IP,
PACTOR, AMTOR, PACTOR-II, CLOVER, G-TOR, PACKET, DSP, and imaging.
Participate in the nine forums about DSP, new HF modes, TCP/IP, VHF/UHF
networking, BBS SYSOP issues and more. A glance at the program (attached)
will show many forums that will catch your interest!

```
*************************************************************************
* *** NEWS FLASH *** *
* *
* BEGINNER'S FORUM ADDED TO FRIDAY CONFERENCE AGENDA *
* If you are a newcomer to Digital Communications and feel somewhat *
* intimidated by all of the technical "jargon", then the Friday Evening *
* Beginner's Forum is just the thing for you. Veteran instructor John *
* Kaplan, WR0W, will present a "crash" course from 7-9:30 PM to help you *
* feel more comfortable in the Saturday technical forums and discussions. *
* There is no extra cost for this forum - its included in the main *
* registration fee. Space is limited so register now! *
*************************************************************************
```

One of the highlights of the conference will be the presentation of 18
technical papers on the many aspects of digital communications throughout the
day on Saturday. A list of papers is attached. You will receive a copy of
all papers presented.

Many demonstrations of the latest in hardware and software will be presented.
When you leave, you will have an in-depth understanding of the latest digital
communications advancements and techniques. The Saturday evening Technical
Showcase will feature TAPR Special Interest Group meetings for BBS SYSOPs
and on VHF/UHF network building and a nearly-mathless presentation of the

design and implementation of DSP software for a high-performance HF DSP modem based on the $99 TI DSK DSP evaluation module by Johan Forrer, KC7WW.

The Hospitality Room will provide the place to meet old friends ... and make new ones. At the Saturday luncheon you will get to know "who's who" in digital communications. Meet the Engineering staff of manufacturers like Kantronics and Timewave Technologies. The optional Saturday evening diner will provide another opportunity to make new friends.

If you want a break from the Conference, the Mall of America, with hundreds of unique stores, is located within easy walking distance. Your family will enjoy Knott's Camp Snoopy theme park inside the Mall. The renowned Minnesota Zoo is only a short drive away.

The Conference registration fee is $45 per person, which includes admission to all Conference activities, a luncheon buffet and a copy of the technical papers. An optional Saturday evening buffet is $20 per person additional. Registration deadline is August 12th.

For more information about the Conference or special Airline and Motel discounts call or write:

$700 is a ridiculous price. I got a DCF77 receiver for less than
DM 60 (about $ 40), and it had DOS/Windows software with it. I'm
using it now under Linux.

2436. Packet/microwave comm important

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-24 05:19:28 UTC
From: Henry Wertz <Henry@chop.isca.uiowa.edu>
Message-ID: <775027419-0-19295@blue.weeg.uiowa.edu>
Source record: 48228

I got this information out of the August '94 Omni (not the best source
for this kind of thing but..hey.. it's there 8-)
This just kind of shows how satellites are reaching the maximum capacity
in terms of how many they can physically put up.
In 1988, Tonga (with 180,000 people 8-) registered with the ITU to buy
all the 16 remaining unocuppied geostationary slots. The 180 members of the
ITU protested a lot, and suggested the ITU even invalidate or ignore the
request. They cut down the request and are now filing for 7 slots.
Basically, just about all the remaining satellite slots are owned by one
country that can charge all it wants for there use...
The UK, Thailand, China, and Russia are all arguing over 99-101oE (god I
wish ASCII had a degree symbol 8-), Indonesia's Palapa B1 and Rimsat's
Gorizont 17 only recently agreed to share 134oE.
Two PanAmSat satellites and a Papua New Guinean Pacstar are basically
racing to see which one can get a satellite up first at 166oE-168oE.
What I'd like to know is if it would be possible (theoretically... I know
it would probalby be too expensive to be done by individual amateurs 8-) to
set up US-UK microwave or radio links (i.e. land ones) that could take off
strain. I know it sounds like cra (oh yeah.. this goes over the air 8-)
sounds bad with analog, but is it possible to use directional microwaves with
digital signalling to get some clean throughput out of it?

If WWVB is really similar to DCF77 (I don't know WWVB) that price is
ridiculous. Receivers for DCF77 can be bought for less than $100.

>does it cost?

The Heathkit output is true RS-232-C serial, 1200 BPS, 8 data bits,
no parity, 1 stop bit. It sends the time as a series of ascii digit
characters.

The kit is no longer being offered. Heath stopped offering kits some
years back. The last that I heard, the clock was still being offered
as a completed unit from Zenith.

(The completed clock, around the time time that the kit was being
offered for $130, was $400. The kit was a nice week project and it works
quite well still.)

: --

: John Hunley, KN6XZ

Hi John! You will find, I think, that there is very little ragchewing done on HF Packet. Mainly, HF packet is automated forwarding, leavened with a few BBSs. The bottom line is that AX.25 is ill-suited for HF.

Don't dispair though! Lots of ragchewing on amtor, pactor, and rtty on HF. Primary bands for amtor/pactor are 14/7.065-14/7.085. Rtty: 14.080-14.090, 7.065-7.080. All freqs are approximate.

With your setup, you should have no trouble at all. In fact, since we are locals, feel free to give me a landline (I'm good in the phonebook and callbook) and set up a sked on 40 meter amtor or pactor if you like.

The band condx have been rotten lately, so don't dispair if it's kind off tough getting a qso going. Things will improve.

Incidentally, I'm running a similar setup to yours: Kenwood TS850S/AT,
R-5 (20-10) dipole (40) PK-232MBX TNC.

Greetings!

I LOVE the GC-1000 (Heath Atomic Clock monitor)! I got mine about 10 years ago, and it's still working perfectly! What others have said about the RS232 output is correct. I just wanted to throw in my vote FOR it!

I also got mine as a kit, for around $100, I believe. (Though, ten years later, I'm not positive any more.) Back then, it was available as a completed unit for a price in the range of 400-500 dollars.

I'm running mine on an OS9/68030 system. I have written software; that plus Cron updates the system's time to the clock twice a day.

: 73 de John kd3wy
: jeg@aardvark.jhuapl.edu

John,

I cant remember them all but check out:

nic.funet.fi:/pub/ham/dsp

In particular, the 320C26 and w9gr directories. the w9gr directory
contains a ported version of the w9gr software.

If you ordered the 'C26 DSK, you can run the 'C26 software without any
problem. If you ordered the 'C50 DSK, you will have to make a few
changes and re-assembly any 'C26 software.

Email me if you have any further questions, I have both DSK's.

Good luck,

Smitty, NA5K

Source record: 48141

```
The Netherlands, July 25, 1994.
Hello dear reader,

Today I distributed NET_Mac2.3.43.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Fix for mods that prompt for username and password
- Some minor mods for the 'rdate' command
- The NET/Mac versionnumber will now be recorded to TRACE-files
- Align the output of 't s' for large-memory Macintoshes

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

It may have also been uploaded to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

Kind regards,

Adam PA2AGA (e-mail: adam@iag.tno.nl )
( or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

I will be on Aruba from august 8 until august 22, so don't expect any replies
during that period of time...

> ???The network is for a 440 backbone going from CentralWyoming to
> Montana....any help would be appreciated....tnx KE7VS

Your "understanding" depends on where in the circuit you plan to connect
the output of the G3RUH and how you have the audio gain and limiting set
up. The stock MICOR wants to see about 90 mv of audio on the mic input
lead to provide 3.2 kHz of (unclipped) deviation on the carrier. A
properly aligned transmitter (per the factory manual) will have the
transmitter deviation control set so you CAN'T reach or exceed 5 kHz
deviation, and the limiting action will start at about 3.5 kHz. Yes, you
can crank up the limit pot, but since the receiver's reasonably
phase-linear bandwidth is only +/- 6.0 kHz wide anyhow, it won't help much.
You will have to remove much of the Tx audio stages' audio shaping
circuitry, which will affect the gain and therefore the signal level
required for proper deviation into the companion receiver at the other end.

Actually the best place was right in the station's "1010 WINS" nickname.
The authorized call letters are WINS and the frequency is 1010 kHz. You
can calculate the wavelength by knowing that (wavelength -in meters) times
(frequency -in kHz) equals 300,000. No, we don't do homework assignments
while on the superhighway, we're too busy watching out for bad drivers!

Calling all brains! O.k. I am looking for information on any type of digital video modes. Slow scan, fast scan, I have heard the rumors but now it is time for facts. Are there any engineers out there who have digitized video and sent it over 56k lines. What is state of the art? What is on the edge? I am setting up a system and need all the options. Thanks for any responses.

2456. GRAPE GURU?

Hmmm, something wrong there - the G3RUH modem has normally around 8v of
drive level on it's output - check the op-amp and maybe change it for
another type and make sure you're 12v rail is intact.

Cheers, Martin.

: : John Hunley, KN6XZ

: Hi John! You will find, I think, that there is very little ragchewing
: done on HF Packet. Mainly, HF packet is automated forwarding, leavened
: with a few BBSs. The bottom line is that AX.25 is ill-suited for HF.

: Don't dispair though! Lots of ragchewing on amtor, pactor, and rtty on
: HF. Primary bands for amtor/pactor are 14/7.065-14/7.085. Rtty:
: 14.080-14.090, 7.065-7.080. All freqs are approximate.

Had many packet ragchews on HF. Try 10.145 or 18.105, these freqs seem
to be the most active and by convention used only for ragchewing.

2461. Connectionless packet frame generator

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-26 21:08:30 UTC
From: au156@yfn.ysu.edu
Message-ID: <313u0f$qc5@news.ysu.edu>
Source record: 48155

I would like to put together a microcontroller for sending
"connectionless packets" (see AX.25 protocol in 1994 ARRL Handbook)
for automatic weather data. Since the controller would drive a
1200 modem directly, a fair amount of detailed information is
required to bit-bang to create the proper packet framing.

Two immediate questions I have:

1. What is the ISO 3309 algorithm for calculating the 16 bit
Frame-check sequence? Anyone have this standard handy? Is
it a CRC?

2. What segments of the frame can/should be omitted for the
connectionless mode of operation?

If you have designed this kind of packet generator (common in
amateur high altitude balloons, satellites, beacons, etc.) or
know someone who has and is on the Internet, please email me:

I acquired a used KAM about a month ago and am worried about something. Is this unit supposed to "remember" the time when I shut it off? Does it have battery backup for the clock? Every time I turn it on, I have to set the time and date.

If this thing has a battery, is it common or do I have to get it from Kantronics? Any help would be appreciated.

2465. NOSVW304.zip corrupt on all the ftp servers ? Plse help !

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-27 13:44:26 UTC
From: vikki@seastar.seastar.org
Message-ID: <1994Jul27.134426.4011@seastar.seastar.org>
Source record: 48160

Hi All,

I picked up two different copies of nosvw304.zip off a couple
different ftp servers and both copies are corrupted.

I checked archie and other copies I found matched the size of the
two I downloaded *exactly*:
-=-
-rw-r--r-- 1 root root 682260 Jul 24 00:37 nosvw304.zip
-=-

Any suggestions appreciated ! I find it just a bit hard to believe
that I am the only one that has tried to get this and unless something
else is wrong (?) I am out of ideas :-).

BTW: I don't think anything is wrong here as anything else I have
gotten (zipped) comes apart just fine.

I have some delusions :-) about linking the network host to a nos box
and since it has been awhile since I have been on tcp/ip (ampr), this
seemed like a good place to start.

Thanks in advance !

Take care es 73, Vikki

The newer Kam pluses have a bettery backup, and you can order an enhancement board for the older Kams which will have the battery backup. otherwise you will have to reset it....

While we are on the subject of the KAM, I do have one, and it does have the enhancement board. I do have auto forwarding and reversal. My question is this. Does the firmware support the means of transfering a bulletin to another system. I don't mean a full service system. Say for example, I want all ARRL bulletins to be forwarded to the DEC's personal mailbox, but only the ARRL bulletins. Nothing else. I don't think there is, will probably have to do it myself. Thanks, and 73, Tuck, KC6ZEC

: Jan den Ouden

In addition to the methods mentioned, I've seen a techinique that General Electric used in some of their commercial mobile radios. That is that you directly modulate your reference oscillator and force the VCO to track those changes. In this particular scheme the frequency is not digitally synthesized (i.e. no divide-by-n counter). For VHF (140-170 MHz) the crystal frequency was 1/16th of the desired TX frequency, and modulated with a varactor. The VCO operated at the desired TX frequency. The phase detector operated at 1/4 TX frequency (4 times crystal frequency). Pretty obviously there were two doublers following the oscillator. These fed a bandpass filter, then on to the phase detector. At I recall, the VCO was buffered and fed to a D flip-flop which fed a second D 'flop, which fed the phase detector. Because of the high reference frequency, the loop filter was fast enough to allow easy tracking of the 9600 bps modulation.

!!! HAM RADIO AND TUBE STUFF NEEDED !!!

1. I am in search of the following item: 7N7 locking octal vacuum tube for a 1946 era television. This request is a relay for another ham who does not have Internet access.

If you have one, please contact me. See contact points below.

2. The Tufts University Amateur Radio Club, W1KN, Medford, Mass. is in the process of putting together a digital communications network. Their ultimate goal is to permit someone who connects to be able to jump out to anywhere else - say, to Canada, or Chicago - wherever! They also plan to interface the network to the Internet!

In order for this to work, equipment is needed. Their cash has been depleted, so any equipment they do get is via donations. Also, since their cash is gone, none of it is insured. If they get a lightning blow, and it all goes down, or if anything is stolen or fails, it's down.

On behalf of their club (I am assisting), I am asking for donations of ANYTHING you can offer - radios, coax, connectors, cash for equipment and/or insurance for the equipment, computers, TNCs, you name it.

If you can help with any of the above, please let me know.

I can be contacted via any of the following means:

Internet: wy1z@neu.edu

Phone: 617-373-4198 (Northeastern Univ. Amateur Radio Club, W1KBN)

U.S. Mail: Scott Ehrlich, c/o NUARC, 503 Hayden, 360 Huntington Ave, Boston, MA. 02115, USA

Again, any help with either or both of the above items would be GREATLY appreciated!

Thanks much!

Scott

From: parnell_j@kosmos.wcc.govt.nz
Message-ID: <1994Jul28.122741.1@kosmos.wcc.govt.nz>
Source record: 48168

G3RUH Modem.

As a result of my query on usenet re the G3RUH modem, I can now pass on the following information.

The modem is fully described in the 7th Computer Networking Conference. ARRL 1988. (pp135 to 140). The article includes a circuit diagram of the modem. Copies of this article are available from ARRL at $3.00 each. Send email to tis@arrl.org requesting the copy (you'll be billed for the $3.00). Or, if the 7th CNC Proceedings are still in stock, you'd be able to purchase a copy of the whole proceedings for not much more. (Call 203-666-1541 to determine if it's in stock). This info from Jon Bloom jbloom@arrl.org. The paper concludes with a section on the availability of printed circuit boards and eproms from the author, from TAPR, or from Siskin Electronics in the UK.

I now have a copy of the paper, thanks to Steve Davis, ZL2UCX (steve@trimble.co.nz)

If you ask the modem's designer, James Miller, G3RUH g3ruh@amsat.org for details, he will send you what is essentially an abstract of the CNC paper. This includes ordering details if you wish to purchase direct from him. He can airmail to you, completely built and tested modems for 56 pounds sterling (or $US 112.00 in cash) or the PCB plus eproms plus DACs for 30 pounds sterling (or $US 60.00 (cash). These prices are given in his information sheet: Issue 3.6, 1993 Apr 01.

TAPR also have a 9600 baud modem for sale in kitset form.
For details, use their file server: file-request@tapr.org
Use 'enter' for the subject. If you send HELP as the message body, it will send you instructions. If you send INDEX or DIR as the message body it will send you a directory of all of their files. This is worth getting.

For details of their modem and other relevant information, you send in the message body:

```
get /pub/tapr/9600modm.txt
get /pub/tapr/pricelst.txt
get /pub/tapr/taprkits.txt
quit
```

Other files on their file server might be of interest to you.

In particular, TAPR and AMSAT have just announced their DSP-93 kit, which initially will:

"contain the following software: 1200 baud AFSK, 300 baud AFSK, 1200 PSK, 9600 FSK terrestrial, 9600 FSK full-duplex for satellite operations, and various audio filters. These have been developed, tested, and have been in use during alpha/beta-testing.

Software currently under test, which may or may not be released with the first batch of kits include: APT, Digital Oscilloscope, SSTV, and HF modes. User interface software for DOS and Windows is also under development and testing."

The complete kit sells for $US430.

For full details, get: /pub/tapr/dsp93.txt from the TAPR file server as described above.

4800 baud packet is one of the modes used in Sydney, Australia. They use the HAPN modem with some local modifications to improve the performance. A description of this modem can be found in Ham Radio, August 1988.

Kevin, VK1OK says: "We have found 4800 baud to be a good general usage speed, a nice step up over 1200, and not too affected by signal reflections and phase shifts. 9600 baud in our experience is fine for point to point work with beams but not for general omnidirectional usage due to the effects of reflections etc."

So there you have it. It has been an interesting study and my sincere thanks to all who supplied information to enable me to complete it.

: >Semi-automated stations have an inherent problem that the automated end
: >of the connect does not listen for qrm before transmitting, as a person
: >would. Hence the qrm. This happens now depressingly often on HF digital.

: Hmm... Maybe I need to read the NPRM to check for changes. The
: original proposal said, or implied, that semi-automated stations must
: be triggered by a locally controlled station. Automated stations
: could NOT trigger semi-automated stations. That was the idea behind
: it in the first place. The control op at the locally controlled
: station was responsible for checking the freq before he could initiate
: the connect with the semi-automated transmitter.

: I'll be first to admit that I haven't had the time to fully read the
: current proposal.

: Gary (the other one)

Gary, one of us is confused. (Maybe it's me.)

I have understood the following to be correct. Someone correct me if I
am wrong, please.

1) The NPRM allows HF semi-automated qsos to take place in all digital
subbands.

2) semi-automated operations is when a distant station can intitiate
contact with a remote station by keying it's selcal/callsign on a
frequency on which the remote, possibly unmanned station is located. As
is currently done in initiating Paclink/Aplink contacts now.

3) Under this process, the remote station (generally a BBS) will not
listen before transmitting, but the other end of the qso, which will be a
human, of course, is supposed to.

Let me know if I have misunderstood.

Thanks.

: radius, i.e. "free" mobile service? Would that be legal...?

This sounds like a good way to get a 'flame' war started, but here goes.
It sounds like what you're describing is what's commonly know as
a 'simplex autopatch', which would be 'auxiliary operation'.
From part 97:

Subpart C - Special Operations

97.201 Auxiliary station. - (a) Any amateur station licensed to a
holder of a Technician, General, Advanced or Amateur Extra Class operator
license may be an auxiliary station. A holder of a Technician, General,
Advanced or Amateur Extra Class operator license may be the control
operator of an auxiliary station, subject to the privileges of the class
of operator license held.

(b) An auxiliary station may transmit only on the 1.25 m and
shorter wavelength bands, except the 431-433 MHz and 435-438 MHz segments.

So it looks as if 2 meter operation is out. And, of course, one would
have to be very careful not to make business phone calls. See part 97,
section 97.113.

And, you're responsible for anything that goes through your auxiliary
station, so be careful to set it up so only you can use it.

It's a good idea to browse through part 97 any time one decides to do
something like this. Any remote control operation requires care to
make sure you retain control and meet the legalities.

Good luck!!

Hi all--
Related to the previous request, I came across a simtel
repository directory that listed, with a wide array of packet
related programs, a TSR packet program.. I have been unable
to locate it (I think it's called pax) via archie and would
really like to see something like this.

Any hints on whether it's still out?

Many thanks.

: >(Read the comments posted here recently.) But, this is going to be perfectly
: >acceptable for automatic control data stations?? Kind of hypocritical
: >wouldn't you say?

: No. The problem with W1AW is that they *don't listen* before transmitting.
: What channelization buys is the possibility of implementing a much more
: robust method of automatically detecting other activity before transmitting.
: With no channelization, there are an infinite number of center frequencies
: where a signal may be. With channelization, that number is reduced to a
: manageable number that can be checked, manually or automatically, before
: transmitting. If interference *does* still occur because of odd propagation
: effects, it will be limited to the users of that one channel, not to two
: different sets of users as could happen with no standard channel spacing.

: Standard channelization is the norm in all services except the amateur
: service, and is even accepted there for most VHF/UHF activity. There's
: a very good reason why everyone else has gone to standard channels, and
: that reason is lessened mutual interference. Amateurs are being backward
: in refusing to acknowledge the advantages of channelization as a tool for
: interference control.

> radius, i.e. "free" mobile service? Would that be legal...?

1. Yes, this is possible, legal, and is done all the time.
2. You must be a licensed radio amateur to use the amateur portion of the 2 meter band (or any other ham band, for that matter).
3. Commercial communications are prohibited on the amatuer bands, so such systems are limited to personal (i.e., non-business) use.

The bottom line is, if you want a cellular phone, go out and get a cellular phone; they're lots and lots cheaper than the equipment you would need to set up the system you suggest. If you are interested in ham radio, great, but there's a lot more to the hobby than just portable phones. Contact the American Radio Relay League in Newington, CT, for more information on becomming a ham, and for the name and number of a ham radio club in your area. There's lots of friendly hams who will be happy to help you earn your license and get on the air.

2487. Digital Spectrum Offer!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-28 16:11:01 UTC
From: brunelli_pc@delphi.com
Message-ID: <xE5wTA1.brunelli_pc@delphi.com>
Source record: 48188

After reading many posts regarding the unfairness of
the code requirement and the elitism of CW ops, and
superiority of one mode over another, I suggest an
alternative.

First:
A) It is a given that the ARRL will not support ths and
i honestly hope that i am wrong.

B) An influx of new hams is taking place and many of these
operators are interested in digital modes.

C) The future of amateur radio is getting licensed now.

with that said, here 'tis.

The usenet r.r.a.?? newsgroups constitute a watershed of
hams with a de-facto interest in digital communications
and radio-theory. The opinion of these participants vary
widely (as evidenced by the constant bickering!). These
factors combine to provide a forum for the development
of a proposal for the modifications of the current state
of HF spectrum management.

Proposed Alterations:

1) Novice Priv's to include digital-specific allocations, for
example: 7075-7100; 14075-14100; similar allocations on one
or more WARC bands.

2) Generation of an additional written exam, specific
to the theory, implementation, and practice of digital modes.
Coverage of data types, data rates, modulation techniques,
bandwidth, hardware, on-air protocols, Propagation, RFI. and
FCC regulations is expected.

I believe that the resulting impact would be to avail a large
number of hams of spectrum prioritized for digital modes. This
would be in keeping with the "technology infusion" theme of the
no-code. No-code Techs are REAL hams with strengths that have
nothing to do with triodes and air-variables.

WARNING! Flame Bait Ahead....

Q. How valid is a technology that is undergoing a spare-parts shortage?

ASIC's and microprocessors are cheap, reliable, versatile, and were
developed to REPLACE tubes, crystals, hartley oscillators, and

the like. Forcing 75 year old technology to be the yardstick for amateur radio places the future of the hobby in jeopardy.

Ahem....

If the energy of the Usenet participants was directed to change, the potential exists for a shift forward in the status of Ham Radio.

Any Takers???

brunelli_pc@delphi.com

2488. Version 2.1 of SimpTerm available soon!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-28 16:37:32 UTC
From: jwl@sedist.cray.com
Message-ID: <1994Jul28.113732.8337@walter.cray.com>
Source record: 48180

I recently uploaded the latest version (2.1) of the SimpTerm program to both SimTel and garbo archives. Look for the official announcement on comp.archives.msdos.announce news group.

SimTel/msdos/hamradio/
simptr21.zip Generic TNC comm program (packet, rtty, etc)

I think it will be in the ham subdirectory on garbo. It replaces simptr20.zip, version 2.0 of SimpTerm.

Version 2.1 of SimpTerm.

SimpTerm is a simple terminal program designed to be used with almost any tnc or tu on the market. Features of SimpTerm are:

o Split window operation.

o Macro key definitions.

o User customizable Help screen

o Most of the non-ascii keys can be used as function keys

o Optional scroll back feature on the receive window and transmit windows

o Simple status display in the middle of the screen

o Capturing of data to a disk file

o Access DOS commands without dropping communications connection

o Control of the com port definitions from command line, init file and keyboard.

o Works on 8088 as well as 80486 and everything in-between.

o Status line

o Small enough to work well on resource tight platforms, like laptops.

o Selcal functions, limited unattended operation.

o Times can be in GMT or local time.

o A station logging function.

o User selectable color scheme

o Automatic "cq" operation (or any other repetitive transmission

o Function keys and control keys can be assigned to a macro
string, cause a file to be uploaded or call a function within
the program.

There are loads of programs that are tailored to specific tnc's and
there are dozens of good terminal programs that can control any
tnc in a "dumb" (that's a technical term) manner. This program is
an attempt to provide the average ham with something in-between.
It has a lot of features, but not so many as to make use of the pro-
gram or the tnc hard. It requires you to know the commands of
your tnc, but also gives you the flexibility that only direct commu-
nications with a tnc can provide.

2494. Timewave DSP9+ review

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-28 18:47:42 UTC
From: Tom WB7ASR <tom_boza@ccm.hf.intel.com>
Message-ID: <318upn$9t5@chnews.intel.com>
Source record: 48098
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc,rec.ham-radio.misc

I purchased a used Timewave DSP9+ at the Flagstaff, Arizona hamfest for $125 last weekend. Its a 16-bit A/D audio filter, with a 2 watt audio AF amplifier. It does work like the book says, however there are several quirks.

1) When using it to receive 6KHz wide AM short-wave broadcast stations, it narrows the audio pass band down to 3Khz. This makes the audio sound tiny. With the filter in line, 3Khz is the max wide pass band it will produce. However it does a "GREAT" job in eliminating heterodynes, and I mean GREAT !!!

2) When in the 100 Hz CW mode, it has ringing. I was real surprised to hear ringing with a DSP filter. It make the 100 Hz mode useless.

All-in-all, its a good filter for CW and DATA.

Above comments are my own.

No, the KAM doesn't support that. But you can use the "paKet" program
(available via FTP) to do this kind of thing quite nicely. It works
well with the KAM, too.

In article <1994Jul19.143407.18075@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us (Gary Coffman) writes:
> We need modem modulations that are more robust under HF condtions.

Agreed. (ah, but a classic chicken and egg problem, too)

> PSK is one direction, MSK too.

Hold the phone. PSK doesn't work well on HF with F2 propagation unless you are really close to the MUF. The reason is the multiple paths that signals can take cause all kinds of phase distortion of the signal. If the phase distortion becomes too great, it can render even FSK unusable.

(Ever wonder why 300 bps packet is mostly on 10 and 14 MHz, whereas RTTY and AMTOR run fine on 7 and 3.5 MHz, even 1.8? Multipath! At 300 bps, multipath overcomes the 300 baud symbol rate. At 110, 100 or 45 baud, multipath isn't so much of a problem. I've always thought that HF packet might get higher overall throughput on lower bands if we lowered the symbol rate to 150 or even 100 baud)

MSK is just FSK with the smallest possible modulation index. Helps to conserve bandwidth. Standard 200 Hz-shift 300 baud packet is pretty close to MSK. Going to a 150 Hz shift would do it. A net gain of 50 Hz. Big deal.

> Another tack is a multi-tone system like Piccolo.

Mutiple tones is the way to go for HF. You have to keep the symbol rate low and avoid phase modulation to avoid multipath phase distortion. You can't get too many states of amplitude modulation because the signal references change too much. It is nearly impossible to equalise a lot of the imperfections of the HF link since they change so rapidly. Your only choice is to use more tones.

HI Bill... you've found me! We have about 20 kits available right now.
Below is our email "blurb" I send out. Let me know if you need more info....

73/Bob KA4BYP ka4byp@netcom.com

BTW... I just noticed the blurb didn't mention the Ottawa PI Card to
drive the modem with, contact Barry bm@hydra.carleton.ca for details on it.

Heatherington WA4DSY 56KB RF Modem

GRAPES (a Non-Profit Volunteer Organization of Georgia Amateur Radio
Operators) is selling full kits of the WA4DSY 56KB RF Modem for $250.
The proceeds from the kits support our packet network building activities.

You will need a transverter with a 28 MHz I.F. for the band of your
choice, a case, connectors, power supply and frequency determining
crystals. The printed circuit boards, documentation, State EPROM,
support diskette and all other parts are supplied.

The transverter chosen should switch as quickly as possible in the
5-15 msec range to be effective. We use the Microwave Modules MMt 432-28S
units; however, these are getting difficult to find except as used ones at
hamfests. The last few we purchased new were also pretty expensive ($389).
We believe that their 220 MHz units were quite a bit cheaper, but we've never
bought any new. On the hamfest market, we have been paying $125 to $185
for used, normally working units.

Maple Leaf Communications (Bob Morton, VE3BFM) is shipping a 220 transverter
which has good charactertistics and an even better price tag ($279). We
have two of these units and they seem to work fine. Contact Bob at
705-435-0689 or RR #1, Everett, ONTARIO, Canada, L0M 1J0.

The transverter must be linear as the modem has amplitude variations as part
of the converyed modulation, which must be reproduced by the transverter.
Usually any transverter capable of SSB operation is suitable if it switches
quickly enough.

We also sell a printed circuit board set that includes the State EPROM,
documentation and support diskette for $110. Documentation sets are
available separately for $20 and we have a VHS (beta by special request)

Video tape featuring Dale Heatherington explaining the Beta modem design for $20.

Doumentation sets are creditable towards the full parts kits or board sets and the board sets are also creditable towards the full parts kits.

We pay U.S. shipping, however, we do require that the approximate difference between domestic ground delivery and premium shipping be sent in advance. Overseas second day air can cost up to $60 per kit! The kits weigh about 2.5 pounds each, and we can put 3 to 4 kits in a single box to save on shipping.

Please send orders (a letter is fine) and your check payable in U.S funds to:
GRAPES, Inc.
PO Box 636
Griffin, GA 30224-0636

We're sorry but we cannot accept Purchase Orders nor Credit Cards. Please allow four to six weeks for delivery.

While you didn't mention them, yes, there are several 70cm 9600 bps
frequencies operating in the NYC area. There's a full duplex bit
regenerating repeater on 448.775-. It's known as 450dux and is the
basis of the Eastern Queens/ Western Nassau LAWN (local area wireless
network). It also has a link East to Suffolk and beyond.

There's also a 9600 bps net/rom node on 441.600. However, it's actually
about 2 to 4 khz low on xmit, and goes deaf for many random duration
periods each day. It's operated by the EastNet folks who have been
attempting to correct the problems for several years without success.

Hope this helps.

Source record: 48189

Hi Dave ...
When hurricane Hugo hit Puerto Rico, a city to my west was besieged with requests for traffic assistance. The club put up a MSYS BBS and began forwarding into me. I, in turn, got it to HF forwarders who got it to KP4OO in Florida. (The Floridian traffic official made pre-hurricane plans as to where to deposit the health and welfare until it could be sent through. A INCREDIBLY smart idea which must have been too much for the traffic folks because it has not been done again.) The club also needed to keep track of a whole gambit of administrative functions like staffing, keeping track of resources, keeping everyone informed as to what was necessary, etc. The MSYS board came through meeting every need.
I and other NEOH boards discontinued bulletins and set our files for optimizing the Lorain, Ohio to HF forwarder paths.
I entered a bunch of messages myself and was VERY, VERY surprized at how many people got word via amateur radio and how many return phone calls were made based on the packet messages.
Lorain now has a Emergency Management Agency supported BBS.

Don't wait until the disaster hits. It's too late then. NO BBS system can be put together and made to run on a whim. They are too complicated. It has to be functional and in place before the disaster (or you better have one you can clone and set up). We were able to clone NO8M, change the calls and port definitions and get it in place fairly quickly. However, we had the author and two beta sites local to us for assistance.

Sysops want to help. It took just a simple phone call to delete the bulletin routes in each BBS to optimize the traffic flow. Not too many sysops will pass up the opportunity to dump all the junk bulletins, just give them a reason!

HF sucks. It has been stuck in packet limbo for eight years due to a prohibition on experimenting with other than packet on other than certain frequencies by other than the annointed. That is the STA. Now that the STA will be going away, perhaps at least semi-automated forwarding will progress into something other than a bunch of minor fixes to AMTOR. This leads me to stating the question about what you are going to do with your traffic? If you have 100 messages for Florida, how are you going to get them there? We were able to get a APLINK set up in Florida that we were able to move the traffic to. You better have some in service routes or you are going to have a heck of a time getting to your destination. Dumping Florida on VHF to the next BBS south of you does not constitute moving it.

73,
Steve

It's legal, but most of us don't have RF equipment with sufficient
bandwidth to make it practical to split the channel this way. In
most cases, we want all the bandwidth we can muster for our own
use without splitting it.

>hello all, just wondering if there is anyway to use my modem as a TNC
>if I have a program for the baymod or similar????

If your modem is a typical telephone Smartmodem, no. If your modem
can be persuaded to behave as a Bell 103 dumb modem, it might be
usable on HF. If it can be persuaded to be a Bell 202 dumb modem,
it might be usable on VHF. But the Baycom program doesn't expect
a Smartmodem, so you'd have to write your own software. And Smartmodems
don't expect to be handed HDLC data, so you'd have to convince the
modem's internal processor to get out of the way.

I thought the military found that the single-tone serial modems proved
superior to the parallel tone modems under most HF conditions.

We are using some parallel tone modems (1200 baud) at work and were
thinking of changing them out next year for the single tone modems
(maybe Harris).

I wonder if the AEA DSP modems would be capable of the fed standard HF
protocols. 4800 baud signalling rates on the ham bands would be nifty.
Maybe some brave soul will volunteer to write some code!

hmmm? 8^)

You may want to try one of the simtel mirror sites such as oak.oakland.edu or wuarchive.wustl.edu . The simtel site itself was shutdown, but these sites are still kept up to date.

Alternatively, if you can find one of the simtel cdroms, you may be able to get it from there. I have one of these, and may be able to email you a copy if I can find it and you can't find it elsewhere. Send me a note and I'll see what I can do, but try the ftp sites first (or try archie).

regards,
Dean.

>Well said Gary!!!

>John B

>john.boyer@rd.eng.bbc.co.uk

We tried channelization on a former amateur band several years ago. It worked for a while and became very popular until the sunspot cycle shifted from low to high. Then there was chaos and bedlam. The poor blokes could not talk across town in Boston for being jammed with hetrodynes from LA. After that the system fell into abuse and disuse. Equipment vendors went out of business, etc. -- Lessons learned!?? Don't do channelization on HF bands.

It seems that automatic operation is causing problems in GB. Does anyone have any of the details on this? What is an agreeable suitable emergency close-down procedure? Is this a contractural obligation on the part of the operator and the RIS? What are the penalties for failure to comply?

Sorry, have to say, no, it's not going to work. The modulation standards
used for phone modems and packet radio are different. The closest you could
come (and it >has< been used before) is to find an obsolete Bell 202 modem
and modify it for radio interface, TX/RX control, etc.

Even on VHF, multipath propagation can cause similar problems. DMCA is one mode that uses 4 independent carriers, each running 16QAM (4 bits per symbol) to get a total of 16 bits per symbol. That way you can keep the symbol rate down (to reduce multipath interference) while still keeping a high bit rate.

The Europeans are big into OFDM (Orthogonal Frequency Division Multiplex) for things like digital TV and DAB (Digital Audio Broadcast) for the same reasons. OFDM uses hundreds of carriers spaced orthogonally (1 bit rate apart) to obtain very high bit rates with very low symbol rates.

I can't speak to the relative speed of the PC vs the Mac with
Hostmaster/KPC-3; however, I have been using a KPC3 with a variety of Macs
(IIsi, PB145, Plus) and a very impressed with the package. Hostmaster is
self documented and runs very smoothly even totally mobile on a PB145.

HostMaster is requires 512K of disk space so putting it on 800K disk with
Sys6.0.7 would be the best alternative in your situation (unless you have
persuaded the Plus or the Classic to accept a 1.4M SuperDrive then you
could run Sys7.0.1).

From experience, I have found packet programs more generally useable with
the Mac than PC (provided you have MultiFinder or Sys7). But I very Mac
biased.

In article <py-QrrJ.moleman@delphi.com> moleman@delphi.com writes:
>I've spent the last 2 days trying to get my KAM and HTX-202 to communicate with
>each other. I am receiving packet data just fine
>but cannot seem to make a connection. The HTX-202 is transmitting, but I
>suspect the mic connection is not wired properly and it therefore just
>transmitting useless noise. I am not very technically oriented, so I would
>appreciate any advice as to the correct wiring for the mic. Any other
>suggestions would be greatly appreciated. Tnx.

The following circuits work for RS, Icom, and Yaesu HTs.

This one's small, it can be build into the plug.

```
C
TNC AF OUT------||----x--------------> HT mic tip
R |
TNC PTT-----/\/\/\/\--x

TNC AF IN-----------------------------> HT ear tip

TNC GND-------------------------------< HT ear ring
```

C may be included in your TNC output circuitry, but can be a 1 mfd
capactitor otherwise. R is the "leaky PTT" resistor. A value between
2 kohm and 10 kohm will trigger the HT. Icoms work with a higher value
resistor, Yaesus require a lower value resistor. RS will need a bit
of experimentation, but a 2k to 4k resistor should work fine for most
of them.

This circuit is better because it offers faster and more positive
PTT.

```
T
TNC PTT---------))))))))---------> HT mic tip
========
TNC AF OUT-------)))))))--x--------< HT ear ring
|
TNC GND-------------------x

TNC AF IN-------------------------> HT ear tip
```

T is any small audio interstage transformer. A 600:600 ohm unit
is nominal. You can salvage these out of old transistor radios,
or get one in a Radio Shack grab bag. They're small enough to
heatshrink into a cable or piggyback on a connector.

-=> Quoting Morris, Robert Bradley to All <=-

MRB> I am interested in purchasing a Kantronics KPC-3. I am new to Packet
MRB> so I am looking for something that is easy to setup and get going, yet
MRB> will last me for
MRB> a while. I will be using it with an older PC and a Yaesu 5W handheld.

Great choice. I just got one myself last week. Quite a nice investment
in my opinion.

MRB> What are your thoughts on this piece of equipment? Will it support
MRB> both HF and VHF operation? At a later date, I might be interested in
MRB> doing some HF packet and would like to know if the KPC-3 will allow
MRB> this?

In reference to page 25 in my Reference Manual, the HBaud command will
allow 300, 400, 600 or 1200 baud, but the modem tones will only use the
1000 Hz shift whereas most HF packet uses a 200 Hz shift. I paid under
$175 Canadian ($119 US) for this great toy and its even got WeFax
capabilities as well. Even if you are using a radio that has no squelch,
you can do it with the software by using the CD (carrier detect) command
like: CD SOFTWARE and will do everything for you. Quite a nice feature.
The box is sure a small one. I am planning on making a special spot in a
5.25" drive bay that can slide in and out for it. Good luck in choosing a
tnc.

Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

You may be wired correctly, but just need to increase your audio output
in the TNC.. Check your manual for the part concerning "connecting
the TNC to a handheld radio" and you will find a "jumper" to move
for this type of operation. Once you have done that, you can adjust
your audio output level - the best down and dirty way is to monitor
your signal with another radio (scanner for example) and listen
how it sounds compared to others on the frequency. Adjust the appropriate
place to make the two sound as close together as possible..

There have, apparently, been a couple of cases of rogue transmitters interfering with other services, and the RIS not being able to close them down. The new condition is not particularly onerous: We just have to tell the RIS how the station can be closed down if the need arises.

There are lots of nit-pick questions being asked about the fine points of what "unattended" and "attended" actually mean; but with a few dissenting voices the new condition has been accepted as reasonable and even desirable: if your gear does go crazy it is better that it can be closed down reasonably quickly.

Suitable procedure? Not well defined. Concensus seems to be "if need be, can your transmitter be switched off within <n> minutes, even if you are away on holiday at the time?". The trouble is that nobody yet knows what <n> is.

One datum: Our club station, way up in the hills, runs an unattended node. The close-down procedure we have set up for that is to provide the home and work phone numbers of three key holders, any one of whom should be able to get to the site within about 30 minutes. The RIS have raised no objection to this.

Contractual obligation? Well, it runs roughly like this: The RIS are the field arm of the RA. The RA is a branch of government. The government makes laws. If they get *really* out of line we vote them out of office...

Penalties: Nobody knows yet, as no-one has yet fallen foul of the change. Available sanctions range from a verbal or written warning,

through removal of priveleges, through to a fine of several thousand pounds. From recent history, the RIS are only interested in the most egregious offenders.

A great job with a great company is available for an experienced VHF/UHF systems engineer with extensive experience specifying land mobile radio systems --- base stations, repeaters, trunking. It's a "box" level assignment.

The company deploys such systems throughout the former Soviet Union, through New York and Moscow offices.

Experience in the following regions helpful:

* Motorola experience, two-way; indoor and antenna
* Point-to-multipoint UHF
* Knowledge of vendors and comparative price/benefit of alternative solutions
* Microwave terrestrial and satellite
* Computer skills for presentation to clients & colleagues.
* Internet to AX.25 radio links
* Good health and ability to travel 4 times a year to remote sites in former SU
* Amateur radio license/experience/fanatacism/menatlity a considerable plus

Please state salary requirements in e-mail reply. Company offers full benefits and alot of challenges.

To carry this just a bit further...

I recently discovered a new newsgroup on one of the systems I have an account on. It is very interesting reading. Look for uk.radio.amateur. I don't think it appears everywhere, and I wonder why it is on that system, especially considering almost no other groups are currently working.

Anyway, from what I have been reading lately, a suitable shutdown procedure can be as simple as a key switch that the neighbor has a key for. It was specifically stated that the party who shuts the system down does not have to have a license. A license would be required to enable such an unattended station, but none to disable it. One shutdown procedure consisted of merely giving the local RI the work and cellular number of the control op. It was also suggested that giving the key to the switch to the local official "might" work, but hadn't been proven yet.

In my opinion, the Brits have a much more practical way of dealing with this than we do. By the way, check out the TVI subject. It's also quite interesting. It's a shame that all logic gets buried in legalese on this side of the pond.

Gary

In article <wyn.74.2E392468@ornl.gov> wyn@ornl.gov "C. C. Wynn" writes:

|> It seems that automatic operation is causing problems in GB. Does anyone
|> have any of the details on this? What is an agreeable suitable emergency
|> close-down procedure? Is this a contractural obligation on the part of the
|> operator and the RIS? What are the penalties for failure to comply?

One of the problems has apparently been that unattended stations have been sending signals out of band which have interfered with our emergency serices. I understand that the Fire Brigades have suffered this from time to time. One possible cause of the problem is the proliferation of ex-PMR transceivers, re-aligned by amateurs but fitted with amateur spec Xtals instead of the commercial spec for which they were originally designed. Either way, there have been instances of transmissions obliterating traffic outside the amateur bands and some of those instances have been traced to unattended operation.

The RIS appear to be happy to accept notification, per se, that a station will be running unattended, provided only that they are given a means of having it switched off if necessary. Different OM have obviously submitted different arrangements, ranging from complicated "open OFF / coded (or keyed) ON" switches outside the shack and a list of telephone numbers manned by other amateurs to simple assurances that someone on the end of a (supplied) telephone number will be in a position to switch the station off if asked so to do by the RIS. The RIS do not appear to be adopting a difficult attitude to the new requirements and first reports are that local officers are actually being very helpful.

There's plenty of argument (as usual) within the hobby about what does and what does not constitute "unattended operation". Likewise about what length of delay between being asked by the RIS to switch the station off and actually getting it switched off is acceptable.

There hasn't been a specific definition of "unattended" and it's probably better that there isn't. Most of us are applying common sense to simple English ;-} As to the delay aspect of it, some local RIS officers are known to have accepted arrangements with a built-in maximum delay of as much as two hours !

In so far as these requirements now form part of the UK Licensing Conditions, I guess you could say that they are part of a contractual obligation imposed on the licensee.

Penalties for non-observance (possible loss / suspension of licence, fines, seizure of equipment etc) are the same as for any other

transgression of the Wireless Telegraphy Act 1949. I'd have liked to
quote them for you, as you asked, but I don't have the Act handy.
Maybe someone else in the thread will elucidate on them shortly.

>
>Dennis, N1RDN

It's real easy to connect the HTX-202 to the KAM, Dennis. First install the HT
jumper inside the KAM. This jumper includes the isolation circuitry for
keeping audio out of the PTT line. Now connect ground to the ring and audio
to the tip of the external speaker connector. The final step is to connect
both the PTT and MIC lines to the tip of the microphone connector.

```
Ring
| v Tip
|-----\ v
AUDIO ----| ====
-|-----/
GND ---/
|
|-----\
PTT+MIC ----| ====
-|-----/
---/
```

Not a pretty picture perhaps, but hopefully it'll do the trick.

For $400, one could buy an OEM GPS module that outputs the time.

MiniSport Laptop Hacker - Vol #22. July 1994
To discourage pecuniary interests, Copyright (c) 1994 Brian Mork

>>> ADMIN
The MLHacker series is formatted to print out on 8.5"x11" sheets manually fed into an Epson LQ-850. I print at 8 lpi, which gives 82 lines per page. Back issues are available from ftp.cs.buffalo.edu in the \pub\msdos\ham-radio directory. E-mail server ham-server@grafex.cupertino.ca.us also has them in the directory \hamradio\newsletters. Note in the signature block that my Packet Radio has changed.

>>> ALTERNATE BATTERY SOURCE
In April Jim forwarded me results of his efforts to modify 9.6 volt Makita power tool batteries. Cut directly from his Internet message, here are his observations (thanks Jim!):

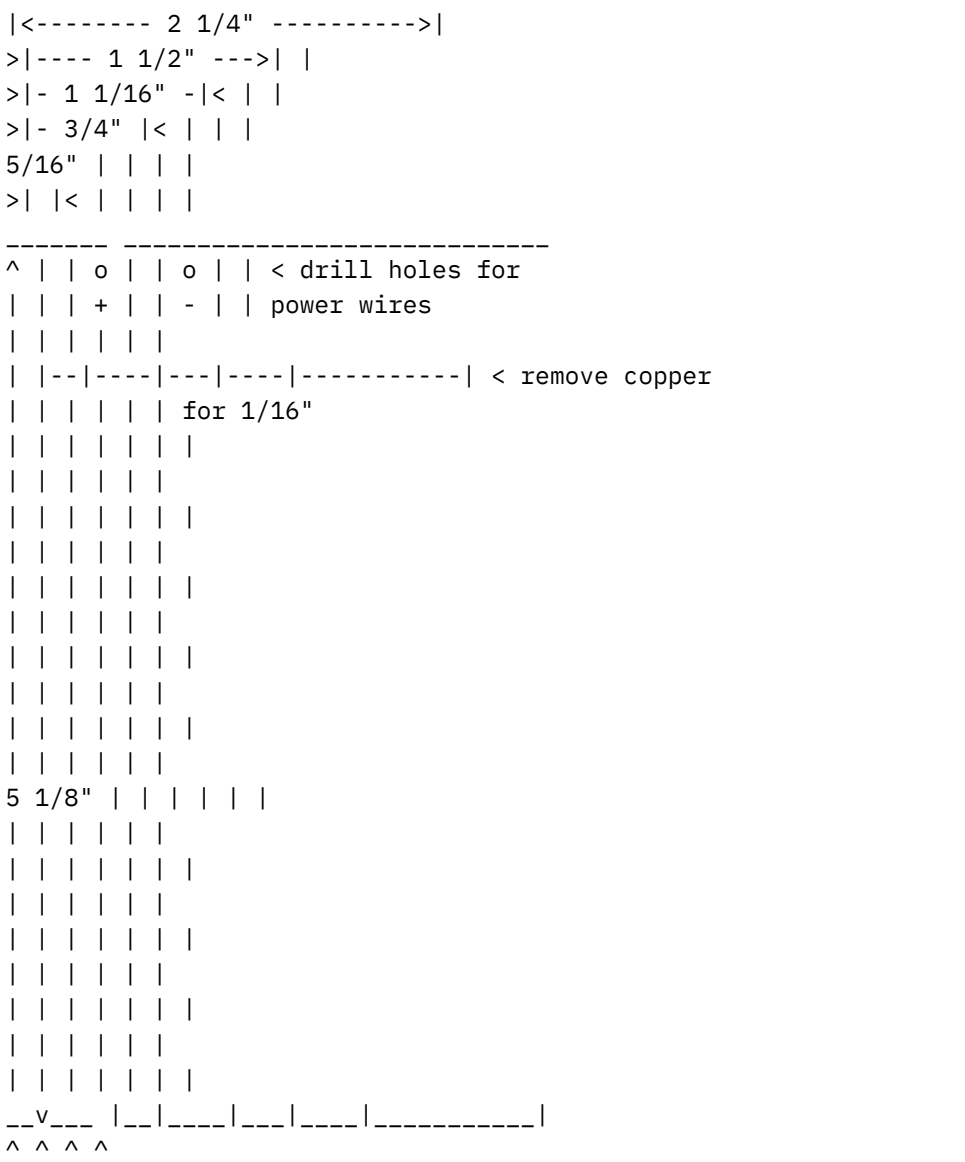
"Just the other day I did something I've been dreading for 6 months. I removed the stock battery from my Zenith ZL-2 Minisport and connected a variable voltage power supply directly to the computer's power terminals. After adjusting the supply to six volts, I powered up the computer and verified that it was working properly. Then, taking a deep breath, I slowly cranked the power up to ten volts. No explosions, no complaints from the Minisport power supplies, It took it just fine. Great, now I can use my 9.6 volt Makita batteries with the laptop as part of my portable packet station.

"Since the internal Zenith supplies are all switchers, current drain is inversely proportional to battery voltage. This means no power is wasted regardless of whether the voltage is 6.0 (stock Minisport battery) or 9.6 volts (as in my Makita pack). I measure 450 - 650 Ma drain with a 6.0 volt source (depending on backlight brightness), but with a 9.6 volt source, only 340 - 425 Ma is needed. The Makita batteries are about 1400 MAh capacity and run my ZL-2 for 3 hours with the backlight on full. Obviously, a 7.2 volt external would work also, with proportionally reduced operating time.

"I had to make a better way to get the external power to the machine than the alligator clips I was using. I thought I'd share what I built with you all. Here's how to make a fake battery pack for your Minisport.

"Begin by cutting a 2 1/4" by 5 1/8" piece of single sided glass epoxy Printed Circuit board material. Remove 1/16" strips of

copper along five lines as shown in the following diagram.



Remove copper along these four lines

"Drill the two holes close to the edge so solder will not interfere with the power contacts on the machine. Only the two small rectangular areas with holes will actually be energized. Isolating these minimizes the possibility of short circuiting the battery. Nevertheless, you should always disconnect the external battery when the fake unit is removed from the computer.

"You can remove strips of copper by double scoring the material 1/16" apart along the indicated lines, then gouging out the metal with a knife or wood chisel. With some patience, you can also do it with a hacksaw or a hand grinder. My favorite method is using a 1/8" drill bit in a small drill press as a router. I raise the table until the PC board is just touching the drill bit. Then one or two thickness of 3 x 5 card under the board

raises the copper just enough so I can route out metal along the lines by moving the board under the bit while it's turning at the highest speed. I have a piece of wood with a vertical fence screwed to one edge that I can "C" clamp to the drill table to help guide the PC board while routing.

"You will need to solder a power cable directly to the board, or glue some sort of jack on the board to accept a power cable through the battery cover hole. The NEGATIVE terminal is nearest the front of the Laptop. The POSITIVE terminal is the rearmost. You won't need a connection to the center terminal, it is used by the Minisport charging circuit. Use a minimum amount of solder and file the solder bumps down smooth.

"Complete the fake battery by gluing a block of wood about 1 inch high to the glass side of the PC board. This takes up the slack in the battery compartment so the board is pressed firmly onto the computer's power terminals. You will have to sand the block to just the right height, or glue on strips of cardboard for extra height if it's too short.

"One problem with using a higher than six volt battery with the Minisport is that the low battery voltage alarm doesn't work. It appears that by the time the 9.6 volt pack is discharged far enough to trip the alarm, it's going down so fast that there isn't time for an indication. Save your work often if you're near drop out time. It should be possible to construct a separate discharge alarm on the fake battery board that will trip at a higher voltage and give a couple of minutes warning.

"I have also created a real battery pack for my Minisport by using one of these routed out PC boards, and hot gluing five "C" size nicads to the top. It works as well as the 1700 MAh Minisport batteries but I have not figured out a way to use the Minisport charger. Also the exposed battery power terminals on the bottom require care to avoid short circuits.

>>> DRIVE EXPANSION PINOUT
On the back of the Minisport is a small plug with a rectangular external form and an internal "D" shape. I have been unable to identify a source for this connector, but several people have asked for the pinout. Here it is, compliments of wa8wzx. The top row of pins 1 through 19 are all sequential odd numbers. The bottom row has pins 2 through 20. Pins 4, 10, 12, 19 & 20 are all ground. Others are:

1 Disk Change 2 Side Select 3 Read Data
5 Write Protect 6 Track 0 7 Index
8 Write Enable 9 Write Data 11 Step
13 Direction Select 14 Drive Select 2
15 RPM 16 Motor On 17-18 Vcc

From: schumann@crl.com
Message-ID: <31hfmr$ane@crl.crl.com>
Source record: 48122

In the past I've seen the TRS-80 Model 100 used as a terminal for packet, and I'm curious about the software/code to do this. I think that the only language that this machine understands is BASIC, so where to find source code might be indicated. (Or was there a chip that handled this?)

Comments, suggestions, etc.?

Jim -

The built-in TERMinal program does just fine in communicating with a
TNC. No additional program is necessary. Just hook up the TNC to the
RS-232 port, and follow the instructions in the TNC manual.

the model 100 has a terminal program in rom... so you can use it with a tnc
it works fine at modest baud rates (between the tnc and 100), but the
display is a tad small...

[Posted on 28 Jul 1994 14:59:14 GMT]

Hello - I'm working on an installation that requires encryption.
We're considering the Motorola 300 series radios, with the
Selectone ST25 encryption.

I would appreciate any information I can get regarding the ST-25,
especially on reliability, security, and error modes.

If there is a more appropriate news group for this discussion, I'm
sure someone will point me to it <G>

Thanks in advance,

It isn't that new - uk.radio.amateur has been around for about 14 months now. I did plug it when it was created and it does have readers from all over the world even though it is a uk group (I suppose it is the best place to ask UK-related questions!)

Has anyone looked at the programmable DSP modems (fax/data)
such as the DSI Connection 144 and similar Cardinal MVP144DSP
for re-programming to the non-phone standards?
These two pc cards are Analog Devices ADSP processors
and download the program from the pc, no roms.
Since they do 9600 baud fax and 19600 &/or 14400 data,
I would think they could do many radio (and TDD) jobs.

This is a non-ham application but I'm sure this is the correct place to ask. I need to set up a temporary HF digital link where one station will be uploading and downloading ASCII (and maybe binary) files from the remote. The remote may not be manned continuously. The equipment will be Kenwood HF Transceivers with PK-232s.

I can use the 232's software at the manned station, what software do I need at the unmanned station? Something like a barebones BBS would be the ticket.

Your quick response is appreciated. I'm available in the following ways:

Packet Folks

Two questions:

1. Does a packet modem driver for Win 3 exist for the Baycom modem? It occured to me this weekend that if Baycom can be used for TCPIP, then it could be used for TCPIP under Windows, right?

2. I checked out the BAYCOM15 program listed in archie searches... My German is not up to the task of figuring out what is going on with that program... Does an English version exist? It is the program that is written especially for the Baycom modem.

Thanks!!

I have a vague memory of some product that was sold to the military some
years ago. It converted 5-unit Baudot to parallel, and then transmitted
the bits in parallel on channels of a standard frequency-division
telegraph carrier system. So the pulse lengths instead of being 22 milliseconds
for 60WPM would be 163 milliseconds. Which was probably pretty effective
on a multipath-ridden channel, but of course used six channels of the
multiplex, where each one would have been sufficient for a TTY channel
in the absence of multipath. But it was a pretty cheap retrofit to
existing equipment to accomplish the desired purpose.

NEWS: TAPR to make available ARRL CNC and DC Proceedings

Please use BID: $TAPR801.001

Tucson Amateur Packet Radio August 1st, 1994

TAPR to make available ARRL CNC and DC Proceedings

TAPR has arranged an agreement with the ARRL to be the distribution point
of past proceedings of the ARRL Computer Networking Conferences and Digital
Conferences. This will apply to proceedings that are more than two years
old. For example, the ARRL will continue to distribute the 12th (1993)
and 13th (1994) proceedings this year, then next year TAPR will begin to
distribute the 12th (1993).

In this way, TAPR and the ARRL hopes that these proceedings will be fully
available to digitally interested hams. Proceedings should be available
from the TAPR office the end of August.

TAPR would like the thank Mark Wilson, AA2Z, and Jon Bloom, KE3Z, for
their help at the ARRL with this arrangement.

There has been interest in having many of the papers available in
electronic form. TAPR will begin to work on contacting authors for
premission to generate computer versions of many of the papers.
If you are an author of an ARRL CNC or DC proceedings paper and would
like to give TAPR premission to make available your paper electronically,
please send e-mail to tapr@tapr.org. If you have the paper in electronic
form already, please send that also. More on this project as it forms.

Greetings -

This is to let you know that a new book is available to packeteers. It is entitled "The Amateur Packet Radio Handbook" by Jim Wagner, KA7EHK. It is the first book I know about which really goes beyond the "how to buy a TNC and use a bbs" level.

It discusses networking, TCP/IP, DX-spotting, KaNodes, Net/Rom, ROSE, TexNet, and much more. If you want a copy of the table of contents or an order form, please send a message to me at wagnerj.csos.orst.edu.

Tnx and 73 de Jim Wagner

Hi everyone

I have a Baycom modem that I am trying to get to work with an old Wang PC that is running IBM emulation software. The Wang runs Telix OK.

I have tried to use Baycom 1.5 with the computer without success as well as tried TPK and g8bpq, again without success. Does anyone know of any other software around that might work with the Baycom modem? If so can you please drop me a line. If you also know a place from which I can download the program I would be grateful also.

Thanks Peter

What do you mean by the word "obsolete" in relatikon to a 202 modem? It's
still the most popular modem when sending data over any type of radio link.
The reason being that the 202 is the ONLY modem which does NOT require a
full-duplex (ala phoneline) audio path to hear the modem at the far end
before it considers itself connected. The reason why 1200/2200 FSK still
remains popular with the amateur packet community is that it works and is
presently the ONLY commercial modem standard that does work!

John,

I use the AEA FAX II and am very pleased w/mine. It works well for NAVTEX
and WEFAX (as well as RTTY, and CW).

Andy N3LCW

2551. Is the KAM 9612 out yet ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-02 15:07:43 UTC
From: pfund@uni2a.unige.ch
Message-ID: <1994Aug2.170743.1@ugun2a>

2552. KaGOLD vs. KaGOLD w/pactor

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-02 15:48:49 UTC
From: kenman@iastate.edu
Message-ID: <31lpt1$5vb@news.iastate.edu>
Source record: 47996

I'm thinking of buying one of the GOLD programs to use with my KPC-3. I'm a little confused: Obviously KaGOLD will work fine, but will KaGOLD w/pactor work on my KPC-3? (At a later date, I might want to "upgrade" to a KAM and use the pactor functions).

The limited information I have doesn't make it clear.

Thanks and 73, Ken

2553. Baycomm and English manual

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-02 16:51:08 UTC
From: Bren.Doreck@utmb.EDU
Message-ID: <01HFFLALOXZQ000E97@BEACH.UTMB.EDU>
Source record: 47999

Andrew Lynch posted a message about his German being as good as it could be for reading the Baycomm manual. An English version is available from ftp.ucsd.edu. Path is hamradio/packet/baycomm. I can't remember exactly which file has it, but there is only two that have Baycomm*.zip. Hope this helps.

2555. MFJ 1278 for sale

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-02 17:39:35 UTC
From: will@zeno.nscf.org
Message-ID: <31m0cn$jtj@galois.NSCF.Org>
Source record: 47998

I have a MFJ 1278 with 2400 baud modem (factory installed) which I used up until a couple of years ago. I am interested in selling this item. If you are interested in making an offer, I will consider all offers and will let it go to the highest offer assuming I get any that are not in the "give it to me" range. You pay shipping offers will be considered over I pay shipping offers with the same price. It does all the standard stuff. Packet, rtty, amtor, sstv, fax, etc. Don't know what the newer models will or won't do as compared to this one, but if you want digital at a deal, this might be for you. I also have the MFJ Multicom software (IBM) if you want this...(cost me $50) be sure to mention and add this into your offer.

Purchased mine locally for US$209 last week. Funny thing is the manual is
copyright dated July 1994!

The pactor option will only work on a KAM, it will not allow pactor to
run on a non-pactor tnc.

2558. Packet Radio BALLOON FLIGHT!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-02 21:19:42 UTC
From: danander@cc.usu.edu
Message-ID: <1994Aug2.151942.24311@cc.usu.edu>
Source record: 48002

Mars Aerial Platform(MAP) Balloon Packet Format:

Call Sign N7UXC

Field Description
First Line
1 GPS Available (1=Yes, 0=No)
2 # Satellites available (3=2 Dimensional, 4=3D)
3 GPS Date/Time UTC (Example 8/02/1994 09:15:45:333)
4 Latitude (Example N 45°22.45)
5 Longitude (Example (W 111° 22.45)
6 Altitude (Meters)
7 Velocity east (m/s)
8 Velocity north (m/s)
9 Velocity up (m/s)
Second Line
10 Balloon Temp (°C)
11 Inside payload temp (°C)
12 Outside payload temp (°C)
13 Balloon differential pressure (inches of water)
14 Battery Voltage
15 Argos flag

The packets will be transmitted every 90 seconds on 145.750 Mhz.

I would appreciate copies of the data that anyone might collect.
If hard copy, please send to:

Stan Wellard N7UXC
1695 North Research Park Way
Logan, Utah 84321-1942

or E-mail to SWELLARD@SDL.SYS.USU.EDU

or Fax to (801)755-4299.

The balloon is skeded to depart from Logan, Ut at midnight ±
1 hour tonite, August 2. If it doesn't get away tonight, we will
keep trying every night until it flies using the same window.
The ground track is expected to be a beeline from Logan towards
Eureka, Ca.

The balloon, at 36.6 Kilometers or 120,000 feet, traveling
at about 40 knots , will be followed by Stan, N7UXC and Gil
Moore, N7YTK and we will be talking with hams as we travel west.

2560. Periodic Announcement - ARRL Email Information Server (info@arrl.org)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-03 03:00:03 UTC
From: mtracy@arrl.org
Message-ID: <rec.radio.info-arrl.email.info_775882802@ve6mgs.ampr.ab.ca>
Source record: 48042
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

> or slower then the PC?. Does the MAC to TNC cable special?? Thanks f
> reading this..Hope you can help..Jeff

Jeff, It really won't make any difference which computer you use. The
big difference will be which software you like. That's assuming you are
going to use AX-25 Packet. In that mode, the TNC just looks like a Modem
to the computer. Matter of fact, I run Procomm when I do AX-25 with my
PC. I suppose one difference might be, if you are using an older PC (XT,
slow 286) and are unable to run 9600 baud between the computer and TNC,
then you might see an increase in the presumed speed with the MAC. AX-25
packet with the KPC-3 is still only 1200 baud on VHF and 300 baud on HF.
That won't change no matter what computer you use.

As far as cables go, just about any standard RS-232 Serial cable will
work just fine. The only difference would be the connector on the back
of the MAC.

Hope this helps and let me know if I can be any more help,

>Ron - KA5LUG

I understand that 7.0 has not been released yet because of some
problems. DK8JV was asked to send his latest version for distribution
at the Ham-Radio show here in Germany by the end of june and he sent
version 6. That was a few weeks ago but the local 'faxers' i've asked
also haven't seen it yet.

What about some RTTY or Amtor while u wait? :-)

Hello dear Ron,
I talked to Eberhard, DK8JV a few days ago.
JVFAX Version 7 will be released within the next two months.
At the present time only "Beta-Releases" of Version 7 were given
to a limited group of persons.
So please "qrx" and keep waiting

As I understand the Telebit PEP protocol (used in Telebit landline modems),
it divides the telephone bandwidth (3kHz) into 512 or so frequencies, then
sends bits down each frequency. I believe they do use phase modulation on
each frequency, since they are set up to send 0,2,4,6, or 8 bits per baud,
per frequency. Given the earlier comments about HF propagation, something
similar but without the phase stuff (i.e. 1 bit per baud) might be interesting,
then restrict the width to the number of distinct frequencies that can
fit in 500Hz.

Telebit uses a TI 320xx chip (I forget which one is in the latest modem) to
generate the waveform. It sounds downright ugly if you accidentally pick
up a phone and listen...

Curious why you see the AEA as a better deal?

As far as I can tell from the literature, the AEA can only
run one channel at a time (either 1200 OR 9600) while the
Kantronics can run both at once (both 1200 AND 9600).

Source record: 48014

I have a friend trying to get his packet station going. He has a Tandy 1000EX with the memory expansion board giving it 640 ram. It loads up DOS fine, but when he loads up a packet program, it gives an error message:Pack File Corrupt. Does anyone have any suggestions on correcting this problem. He has an AEA PK232-MBX tnc also. Any help would be appreciated. 73's de KE4CLE.

Greetings! Has anyone out in netland used the baycomm modem with an amiga? If so did you use it with amicom software or
amiganos? Did you need to make any mods to the baycom? Any info is appreciated.

I have downloaded a copy of net mac and am now configuring it for my Mac...

I would like to learn the paths to get connected here in northern california. The most reliable mountaintop for me is Sonoma Mt on 145.73. I live in West Marin county.

Anty help (advice), especially about obtaining an IP address would be appreciated.

Thanks in Advance KD6ZZM

Go ahead and use the Mac with the Hostmaster,it works wonderfully.I've
been using that setup for the last 1 1/2 years and have no complaint.
A standard modem cable will work fine with the TNC and the Mac.I get
better results by setting my abaud to 9600...
Will be glad to be of more assistance.Matter fact,I run a BBS that has
a good collection of Ham related sharewae,might want to give it a call
and see if you could use something.
The phone number is 202-298-6009.
Take care...

2574. Digital RF and Steinbrecher Update!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-04 15:31:55 UTC
From: kevin jessup <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994Aug4.153155.1288@mixcom.mixcom.com>
Source record: 48017
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.policy

I said I wasn't going to talk digital tech-stuff in R.R.A.P. anymore.
So I'll let someone else do the talking! ;-)))

For those interested in digital RF and as a follow-up to the previously
posted REC.RADIO.AMTEUR.POLICY article (a few months ago) on Steinbrecher
digital RF, check out the July 11th, 1994 issue of ELECTRONIC DESIGN magazine.
There are two articles of interest.

On page 80, see "Use DSP Filter Concepts in IF System Design".
This highlights a Harris IC (HSP50016 DDC) which can implement
wide-band digital downconversion. It is the "digital equivalent
of a voltage-controlled oscillator, quadrature mixer and quadrature
filter network".

On page 141, see "Fast ADC Enables Digital Baseband RF Technology".
This highlights the Analog Devices AD9026/7 IC (12-bit 31 MHz).
The following is quoted text from the article.

"Once the province of the military and intelligence communities,
Digital RF finally comes in from the Cold."

"Is the superheterodyne receiver doomed like the vacuum tube that
originally made it possible? The newest generation of analog-to-
digital (ADC) technology seems to point in that direction, because
it's capable of RAPIDLY OBSOLETING ANALOG IF signal processing
at frequencies below 15 MHz. If this high-speed conversion
technology proves viable, VIRTUALLY ALL RF COMMUNICATION LINKS
MAY SOON CARRY ONLY DIGITAL BASEBAND SIGNALS -- strings of ones
and zeros waiting for processing by the soon-to-be ubiquitous
digital signal processor."

"Instead of using a heterodyne process, BASEBAND SIGNALS NOW CAN
BE EXTRACTED FROM THE CARRIER FREQUENCY BY DIRECTLY DIGITIZING
THE OUTPUT OF AN RF RECEIVER'S IF STAGE for further processing
in digital or analog form."

Much greater detail is available in the article. Only a very small
portion was quoted here.

Those who read the Forbes/Gilder post in rec.radio.amateur.policy
on Steinbrecher technology will enjoy this article. It discusses
the application of the technology to Steinbrecher's "mini-cell",
which reduces a cellular base-station to the size of a suitcase.

Steinbreher's approach digitizes a whole swath of spectrum at once,
and can decode both the wideband and narrow band signals that were

"captured" using high-speed DSPs that process the data digitized
at the IF stage.

Further quoting the article...

"Instead of translating a single channel from it's carrier
frequency to the IF, the [Steinbrecher] Paramixer takes a
very wide slice of a communications spectrum (typically
10 to 100 MEGA Hz compared to 10 to 100 kHz for conventional
radios) down to baseband while intoducing virtually no
distortion into the signal under scrutiny. The entire band
is sent over a data-bus to a bank of DSP ICs. Each processor
then decodes one channel from the passing bit stream."

The concept apparently works. The cost is still out of the range
of the amateur community at around $100,000 per mini-cell (10%
the cost of conventional cellular base stations).

Give it time. Sampling rates will further rise. DSP prices will
fall and performance will increase. Let prices fall and integration rise.
What will radio amateurs have on their desktops in 5 to 10 years?
What will the average mass-market comsumer have in their pockets??

I will avoid any sarcastic comments regarding other modes of
amateur operation. To those on r.r.a.p., please note that this
was cross-posted to rec.radio.amateur.digital.misc. This
was intended as an update regarding advances in digital RF.
Given the discussion in r.r.a.p., regarding band-space, spectrum
useage an the like, I felt it was an appropriate post for that
group as well. Note also (as stated above) that the Gilder article
was, in fact, posted in R.R.A.P.

Lets not turn this into another flame war.

If you are intent on flaming this, do it via Email or keep it in
r.r.a.p.

>
> I thought the military found that the single-tone serial modems proved
> superior to the parallel tone modems under most HF conditions.

Which raises two questions. 1) Does the military use HF in the same way that hams do? and 2) What sort of transmitting, receiving and modem apparatus does the military consider "reasonable" for such a circuit.

> We are using some parallel tone modems (1200 baud) at work and were
> thinking of changing them out next year for the single tone modems
> (maybe Harris).

1200 baud on HF? Must be right at the MUF. No way you could get that kind of symbol rate much lower in frequency, unless you've got some kind of multipath equalization. Sounds tough (read expensive).

> I wonder if the AEA DSP modems would be capable of the fed standard HF
> protocols. 4800 baud signalling rates on the ham bands would be nifty.

4800 baud HF packet would be illegal. The regulations limit us to use 300 baud below 10 meters. 1200 baud is permitted on 10 meters.

(Note that baud != bps)

Without having any info on which program he is using, it sounds
like a bad executeable. I would suggest that he try a [plain-jane
comm package like PAX (my favorite for just putting around), or
anything else he would use to run a modem. If he can controll
it with a commpackage, get a new copy of the packet software.
Another good idea would be to check the laptop for viruses!

practice safe computing!

ARRL 13th ANNUAL DIGITAL COMMUNICATIONS CONFERENCE AUGUST 19-21

Do you operate a Digital mode (maybe Pactor, Packet, GTOR or AMTOR) now? Is it hard to keep up with the latest Digital technology? Would you like to know more about Digital modes? If "yes" to any of these questions, then attend the 13th Annual ARRL Digital Communications Conference.

The Conference will be held on August 19 - 21, 1994 at the Thunderbird Convention Center, 2201 East 78th Street in Bloomington, Minnesota. Accomodations are available at the Thunderbird Hotel, at hotels and motels located nearby, and also at several area RV\camper campgrounds.

Enjoy a weekend of fun learning about the latest developments in TCP/IP, PACTOR, AMTOR, PACTOR-II, CLOVER, G-TOR, PACKET, DSP, and imaging. Participate in nine forums about DSP, new HF modes, TCP/IP, VHF/UHF networking, BBS SYSOP issues and more. A glance at the program (attached) will show many forums that will catch your interest!

A highlight of the conference will be the presentation of technical papers on many aspects of digital communications throughout the day, Saturday. A list of papers is attached. You will receive a copy of all papers presented.

Many demonstrations of the latest in hardware and software will be presented. The conference kicks off Friday evening with an educational forum "The Basics of Amateur Digital Communications - A Crash Course for Beginners" with instructor John Kaplan, WR0W. The Saturday evening Technical Showcase will feature TAPR Special Interest Group meetings for BBS SYSOPs and on VHF/UHF network building and a technical presentation on "Low Cost HF DSP Modems" by Johan Forrer, KC7WW.

The Hospitality Room will provide the place to meet old friends and make new ones. At Saturday's luncheon you will get to know "who's who" in digital communications. Meet the Engineering staff of manufacturers like Kantronics and Timewave Technologies. The optional Saturday evening diner will provide another opportunity to make new friends.

If you want a break from the Conference, the Mall of America, with hundreds of unique stores, is located within walking distance. The family will enjoy Knott's Camp Snoopy theme park inside the Mall. The renowned Minnesota Zoo is only a short drive away.

The Conference registration fee is $45 per person, which includes admission to all Conference activities, a luncheon buffet and a copy of the technical papers. An optional Saturday evening buffet is $20 per person additional. Registration deadline is August 12th.

For more information about the Conference or special Airline and Motel discounts call or write:
ARRL Digital Communications Conference

The host of the 1994 ARRL Digital Communications Conference is the TwinsLAN Amateur Radio Club.

See YOU at the Digital Communications Conference August 19-21!

13th ANNUAL ARRL DIGITAL COMMUNICATIONS CONFERENCE
PRELIMINARY PROGRAM

Friday, August 19

TIME ROOM EVENT
Noon - 6 PM TBD ARRL "Future Modes"
Committee meeting.
Noon - 6 PM TBD ARRL "219-MHz" Committee
meeting.
4 - 10 PM Winnebago Conference check-in.
6 PM - 11 PM Winnebago Hospitality & Demo area are open.
7 PM - 9:30 PM Yakima The Basics of Amateur Digital Communications - A
Crash Course for Beginners. Instructor: John
Kaplan, WR0W.
Saturday, August 20
TIME ROOM EVENT
6:30 - Noon Winnebago Hospitality & Demo area open
7:00 - Noon Winnebago Conference Check-in.
8:00 - 8:15 AM Miami Conference "Welcome"
8:30 - 10:00 AM Miami Technical Paper Presentation
8:30 - 10:00 AM Arapaho Forum - Developments in DSP
For the Amateur. Moderator -
Bob Strickiin, N5BRG
8:30 - 10:00 AM Choctaw Forum - TCP/IP - What's next?
Moderator - Lew Shannon, K0RR
10:00 - 10:15 AM All Break
10:15 - 11:45 AM Miami Technical Paper Presentation
10:15 - 11:45 AM Arapaho Forum - ARRL Committee
Updates: "Future Modes":
Moderator - Paul Rinaldo W4RI
and "219-MHz Networking":
Moderator - Tod Olson K0TO"
10:15 - 11:45 AM Choctaw Forum - Digital Data (Voice
and Image) Transmission
Method Developments.
11:45 - Noon AM All Break

Noon - 1:00 PM Miami Buffet Luncheon (Included)
1:00 - 5:30 PM Winnebago Hospitality & Demo area open
1:15 - 2:45 PM Miami Technical Paper Presentation
1:15 - 2:45 PM Arapaho Forum - High-Speed (above
1200 baud) data transfer
methods and networking
techniques.
1:15 - 2:45 PM Choctaw Forum - HF Data Transmission
Methods - An Over-view of
Current Modes and What's
Coming Next. Moderator -
Frank Perkins, WB5IPM
2:45 - 3:00 PM All Break
3:00 - 4:30 PM All Continuation of all sessions
5:30 - 6:30 PM Miami Buffet Diner (Optional)
7:00 - 11:00 PM Winnebago Hospitality & Demo area open
7:00 - 10:00 PM Miami Tucson Amateur Packet Radio
(TAPR) Presents Packet BBS
SYSOP Special Interest Group
7:00 - 10:00 PM Arapaho Tucson Amateur Packet Radio
(TAPR) Presents VHF/UHF Network
Building Special Interest Group
7:00 - 10:00 PM Choctaw American Digital Radio
Society (ADRS)presents a
technical presentation:
"A Low Cost DSP Modem for HF Digital
Experimentation" by
Johan Forrer, KC7WW

Sunday, August 21

TIME ROOM EVENT
8:30 - Noon Winnebago Hospitality & Demo area open
10:00 - 11:00 Winnebago Conference wrap-up and close.

13th ARRL Digital Communications Conference Proceedings

1. A Proposal for a Standard Digital Radio Interface
Written by Jeffrey Austen, K9JA

2. Automatic Packet Reporting System (APRS)
Written by Bob Bruninga, WB4APR; Presented by Gwyn Reedy, W1BEL

Jack, N1REU, has just gotten started on TCP/IP, and needs a nos which will run under Windows. Please tell me what's available. Thanks.

Bill aa1es

I had probmems on my 386 running PA0GRI or Jnos under windows. The system would work for about 2 days of continuous operation and then NOS would cause a GPF fault in windows. Sometimes it would run longer...sometimes shorter. The problem was with the fact that both NOS and Windows were trying to independantly manage the computers memory. For ocasional usage I suppose this wouldnt be a problem. but if you intend to keep your station up 24hours/day I would not recomend it! Perhaps Novell dos 7, with multitasking would solve the problem? Since I added the 486 I have had no need to wory about it...Nos runs fine under dos and I do my serious work on the other machine.

Good luck and best regards:
Tom Eckels

That leads up to my plea or question for you whom know out there.
I would like to know where I can find information on how to hook
this unit up to a RS232 serial port 1 or 2 on my computer. I also
need to know where I hook the radio PLL, PLL audio and rec audio,
and maybe even the ground. Also which Jack I use in the back of
the unit to hook the computer and the radio. I also need to know
if it will operate Kiss mode or Host mode, Host mode is prefferred(?)
I need a copy of the commands which the unit will accept and what
the meaning of the commands are.

If all else fails I would like to know where and if an instruction
manuel is available. If someone out there happens to have a manuel
and would copy it for me I would be more than happy to pay for
the copy cost and shipping......Thank you much in advanced...73's

2583. MFJ 1278 & PACTOR

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-05 10:01:22 UTC
From: erchul@convex.csd.uwm.edu
Message-ID: <31t2liINNqq@uwm.edu>
Source record: 48021

I recently purchased a MFJ 1278B. On the box
in the listing of modes it includes PACTOR.
The manual that came with the tnc says NOTHING
about PACTOR mode. I managed to get the mode
set for PACTOR and receive an "n_cmd:" prompt.
If anyone can help me out with the PACTOR
commands I would certainly appreciate it.
If it would involve xeroxing some pages I
would gladly pay for the copying and postage.

Hi all!

I just want to know which modulation scheme , eg. FSK ,GMSK..etc., to use in
order to run 9600 baud or higher data rates in a 12,5kHz channel spacing.

Thanx

Jakes

From: da884@cleveland.Freenet.Edu
Message-ID: <31tdja$doj@usenet.INS.CWRU.Edu>
Source record: 48028

I was just speaking to a friend of mines upnorth. He like my self
run JNOS and the baycom modem, while we where talking he says that he's been
able to get the NOS program running with L2 and TFPCX, without running AX25
driver. SO, makes me wonder if anyone has been able to get ANY baycom
program that uses the TFPCX or L@ drivers to work in WIndows or OS/2.
If they do work, then I can't see why running those drivers for the JNOS
program won't working in those OS's(Minus Windows, beucase it's not a true OS).

I'm not 100% sure about KaGold, but I use the pactor version of PkGold with my PK88, and my father has it for his PK232. The software works fine on the PK88, but obviously the pactor options are not available (as with all the other multimode options). I think Kenneth understands that.

The main point to remember is that since Gold is a host mode package, it can only use the tnc commands that it has been programmed to recognise. So the non-pactor version can't do pactor even if your tnc can (unless you set the parameters in direct terminal mode - not very user-friendly), but the pactor version will work fine on the non-pactor tnc. Does that make sense? I've confused myself :)

>Ruston, La 71270

I'm not sure exactly what you want.

Do you want an off-the-shelf ready-to-go RF section?
Or the discrete components and/or ICs to do the job?

Narrow band or wide band? Analog or digital? What is the data rate?
Have you decided on a specific modulation technique? You mentioned
FM. Narrow band FM voice?

500 milliWatts or 500 MegaWatts? ;-)
Amateur, commercial or hacker? Guess which of the 3 has less options? :-)))
Legal or clandestine? ;-)

2591. Recommendations on low-power TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-06 00:53:47 UTC
From: cheese@active.asstdc.com.au
Message-ID: <7P6QuABDBh107h@active.asstdc.com.au>
Source record: 48030
Cross-posted to: aus.radio.packet,rec.radio.amateur.digital.misc

I'm looking for a TNC for portable field applications, so low power consumption is a primary consideration. Small physical size would also be nice. It also needs to support KISS (do any TNCs *not* do KISS these days?), but frills like mailboxes and the like don't really worry me one way or the other.

The KPC-3 looks like it'll fit the bill, and the Tiny 2 might too, but I don't have much info on that one. Are there any others I should be considering, or anything (bad) I should know about either of those two?

Thanks in advance,
Mark VK2XGK

Bob,
Here is a recent list of the US IP address coordinators. I deleted the
Int'l folks for brevity. Let me know if you need them, too.

SD

AMPRNet IP address coordinators as of 11 July 1994

Corrections and updates to brian@ucsd.edu.

Note: the people listed here have volunteered to issue IP addresses for
their areas. They are not paid to do this service; please understand
that they are perfectly at ease to deal with coordination responses at
a lower priority than the things that matter more, such as job and
family. Please be patient when requesting an address.

2594. Re: Baycomm

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-06 20:50:59 UTC
From: z002594b@bcfreenet.seflin.lib.fl.us
Message-ID: <320t3j$2va@bcfreenet.seflin.lib.fl.us>
Source record: 48037

Hi Peter,
I also have a Baycom and 2at setup. I use it with my notebook computer
to sit pool-side and digi to the local ROSE switch via my base station
(PK232 with IC228H). The 2at and J-Pole, by itself, will not make the trip.

Only problem I've had is RFI into the RS232 port by the 2at. I remedied
that somewhat by lengthening the transmission line to the J-Pole.

Wonder what Marconi and Maxim might think of these system?

Regards,

Bill Manley (KB4XE).

NE|In the past I've seen the TRS-80 Model 100 used as a terminal for packet,
NE|and I'm curious about the software/code to do this. I think that the
NE|only language that this machine understands is BASIC, so where to find
NE|source code might be indicated. (Or was there a chip that handled this?)

I have a 100 and have yet to use it for packet... but since it has
the terminal software already built in, that is all you should need.

>

I am running a full Winsock suite of Internet tools at the moment, using
a SLIP connection to a commercial provider. I also run a Baypac modem
on the same machine (A Gateway Handbook 486 - at 3 pounds!) The currently
available Baycom software ain't that smart. I have problems running any Baycom
stuff in a Dos box so I usually bail out and run from the (UGH) Dos prompt.

The difference between the two environments is VERY ANOYING!

I have run vanilla NOS with the AX25 driver under Dos with no problems, and
it may be possible to use some of the Packet wedges to make them work under
Windows, but I want a real WIndoze device driver that is Winsock compliant!

I have been reading up on the Winsock interface and am working on a Baycom
style driver. But, I am trying to do that without having access to the
Windows Device Driver development tools. (Who says Hams are cheap?)
A few books seem to say it is possible, but more say plunk down the bucks
and have fun.

There was an interesting talk at the last TAPR meeting on running packet
through Winsock, and thats what started me off on this adventure. If you, or
anyone else have tried working on this - I's like to know how things are
going. I'd like the same quality user interface we see in commercial Windows
applications for my packet work. The current crop of interfaces probably
worked fine when we had teletype machines. (I Know, many hams still DO
have those mechanical marvels - but it is time to upgrade!)

Apparently Micro$oft's messed up again 8-)...until recently EXEPACK had a
bug so it would report a "packed file corrupt" whenever you try to run it in
the first 64K. DOS 5.0 has loadfix.com to fix this, or just load some little
TSR so you have less than umm.. *listens to gears in head spin up* 576K free.
I guess this is fairly unlikely.. you usually can't get 576K free without
loading things high (which you probably can't do on the 1000EX..) but it's
possible.. if that's it, this will help.
If it's not that, then like that other person said, it actually *is*
corrupt and try getting it again, or get it somewhere else...

2599. TNC-20

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-07 12:26:13 UTC
From: flocq@dialup.FRancenet.FR
Message-ID: <199408071024.MAA01981@adynaton.francenet.fr>
Source record: 48043

Hello everybody,

A TELEREADER TNC-20 Packet controler was given to me but without any documentation. Beside that, I believe that the internal software is not the original one. Here is what the startup message says :

```
PacComm TINY-2 Packet Controller
AX.25 Level 2 Version 2.0
Features:
KISS
PERSONAL MESSAGE SYSTEM V 2.3
CLOCK CHIP SUPPORT
CWID
Release S1.1.6B2 17/05/89 - 32K RAM
Copyright U.K. by SISKIN ELECTRONICS
Checksum $B6
cmd:
```

I am just starting with packet and I am looking for a documentation on this box as well as the list of the software commands for this firmware. Also, being a Mac user, what are the best software packages to take full advantages of this controler.

Thank you in advance for all the answers.

73's - F1BAQ

Is anyone out there still using the Digicom>64 TNC/software setup for packet ?
I have said setup and used it for years with no problem. About a year ago it
stopped working (TX ok but RX doesn't 'decode'). I was rather busy then and
when a quick look didn't find the problem....
Message-ID: <7AUG199413352820@pavo.concordia.ca>
Organization: Concordia University
News-Software: VAX/VMS VNEWS 1.41

I want to get this going again. Radio checks out OK. CC64 seems to function
normally with other software....guess it must be the TNC; does anyone know how
I can know if the output of this thing is actually what it is supposed to be ?

The scope shows a bitstream comming from the AM7910 but it is less than
perfectly shaped. Any comments ?

Thanks de Mark VE2HVW

2602. PMP via serial port

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-07 22:42:12 UTC
From: jcraig@kean.ucs.mun.ca
Message-ID: <1994Aug7.201212.1@leif>
Source record: 48048

I posted the following on a few local BBS's last year. It might be
of interest to some. Comments are welcome.

Re: PMP via Serial Port, VO1NA

The PMP system described by N8KEI and WB2EMS (73, Aug,'91) can be adapted
for operation via the serial port. This was done with the "home station
interface" as follows. Invert the DTR line using an NPN transistor
(Rb=Rc=4k7, Re=0, Vcc=5V) and the make the following connections:

```
From TCM3105 | To DB25 pin #
pin # | (serial port)
--------------|-----------------
3 | 8 (CD)
8 | 5 (CTS)
14 | 20 (DTR) [inverted]
```

The inversion of DTR isn't essential. The object is to convert the RS232 to
TTL (assuming the TCM3105 even cares).

Change the ports in PMP.CFG to:

```
pttport 0x3FC 2 0
txport 0x3FC 1
cdport 0x3FE 128 1
rxprot 0x3FE 16
```

This will address COM1. COM2 can be addressed by changing the 3's given above
to 2's. Thanks are due to KI5PG for his internet posting of WB5MCT's config.
file mods.
Although pttport is not needed with the watch dog equipped modem it should
be reconfigured or PMP will default the ptt signal to the parallel port.
The "bare bones" modem should also work but will need ptt. The RTS line of
the serial port will go from -12 to 12 V while PMP activates ptt.
For a DB9 serial port, use the appropriate pins for CD, CTS and DTR (and
RTS if needed.)

This modification will also make the modem compatible with the BAYCOM
software.

A diode should shunt the base of the NPN transistor to prevent the
negative excursions of RS232 signal from exceeding V(EB).

Disclaimer: The only thing I know is that I know nothing except that
I know nothing..... If it doesn't work, I am not responsible.

FSK won't fit, but MSK can. The MSK scheme used in the WA4DSY RF modem, aka
GRAPES modem, occupies 1.2 Hz per baud. That would fit a 9600 baud signal
in 11.52 kHz at the 26 db down points. See the ARRL 6th Computer Networking
Conference Proceedings for a paper on the design.

HT's are indeed usable with packet. If you check the manual for your
TNC, it may well describle the cable needed to connect to a particular
HT. Basically, you use the mike input for transmit audio, and the
earphone jack for receive audio. The actual hookup varies, because
some HT's use a three-pin plug for transmit (Audio, ground, and
push-to-talk) while others use a two-pin plug with the PTT being
a DC ground and the audio isolated through a capacitor.

As to your second question, you don't specify what KIND of repeater
you mean.

> amiganos? Did you need to make any mods to the baycom? Any info is appreciated.
>
> dave
> n9uxu

Hi Dave,

First one info: the Baycom driver only exists for Amicom and not (yet)
NOS / TCPIP (AmigaNos).
If you want to use the BayCom with your Amiga, you need to add one diode
and one resistor to the modem. But doing this will _S_T_I_L_L_ allow you
to use it on a PC, so don't be scared!

If you have any other questions, feel free to contact / post...

2611. 900 MHz spread spectrum systems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-08 19:01:41 UTC
From: wolf@beta.lanl.gov
Message-ID: <325vel$3ua@newshost.lanl.gov>
Source record: 48056
Cross-posted to: sci.crypt,rec.radio.amateur.digital.misc,rec.radio.scanner

lately i've become interested in the level of security actually provided by the 900 mhz spread spectrum phones. for instance, could a hacker with a pc and a smattering of outboard hardware have a good chance of decoding one's 900MHz phone calls?

does anyone have any details on the ss systems used in, say, the escort phones? spreading sequence generator, moduation methods, synchronization schemes, etc.? one of the felows that i talked with at cincinnatti microwave suggested that their phones choose a spreading sequence randomly whenever the phone gets used. is this true?

being a ham, i know that the fcc has allowed hams to use one of two linear feedback shift register schemes to generate the spreading sequence for direct sequence and frequency hopped systems. this makes it extremely easy to intercept a transmission. if the phones were this vulnerable then it would be difficult to make claims of security, eh?

also, since a lot of conversation time is "dead" time - mostly silence - does this provide the attacker a rather simple way to get the spreading code? i am assuming that the digitized voice level is mixed with the spreading code here - maybe someone who has more insight can comment on this method of attack.

if you've got the technical info, please pass it along. i'll post a summary.

I have used the built in firmware terminal program for packet in the
Model 100's extensively and for a basic portable packet system the Model 100
performs beautifully.

2614. HF Modem Circuits?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-08 23:05:45 UTC
From: btoback@netcom.com
Message-ID: <btobackCu8o5M.8n@netcom.com>
Source record: 48061

I'm looking for some circuits that I can use for an HF modem. The current issue of the Handbook refers to the "RTTY/AMTOR Companion" but that doesn't have any circuits in it either. Have there been any modems in the last few years in any of the magazines? Can I just use something like a 565 or 567? I'm looking for something fairly simple; the digital output will be sent to a Z-80 SIO for further processing.

Thanks,
-- Bruce KN6MN

: does anyone have any details on the ss systems used in, say, the escort
: phones? spreading sequence generator, moduation methods, synchronization
: schemes, etc.? one of the felows that i talked with at cincinnatti microwave
: suggested that their phones choose a spreading sequence randomly whenever the
: phone gets used. is this true?

My understanding is that these phones use direct sequence spread spectrum.
I was browsing thru a book on this the other day (idly, at the bookstore
while looking for other stuff), and seem to recall reading that dsss is
the easiest mode to sync to. I think you sort of slide your sequence back
and forth over the signal, and when they're synced, the signal gets clear
in an easily detectable way. (Can't remember the details of that, tho).
If you know what you're doing, and have the sequence, it should be easy.
I think there's lots of snake-oil out there involving security of
these phones. When they say "Uses digital spread-spectrum techniques with
64,000 different codes," they may probably be saying that there's one
sequence and 64K access codes to dial out, which is the same as an analog
cordless with 64K security.
-Steve
p.s. There are reports that the audio is transmitted in the clear on 450
MHz. Not sure of the signal level, tho.

>corrupt and try getting it again, or get it somewhere else...

Just my 2 cents worth here. The Tandy 1000EX is an 8088 based machine.
So, there is no such thing as loading high. And yes, about the max free
memory you get after loading the operating system is about 576k. It was
my very first computer, which I just recently sold to someone starting out.

As to the gentleman's original problem with the file error, it also sounds
to me like the EXE file is corrupt.

Well Mark owning a KPC-3 I can attest that if you select the "leds off "
and setting "cd internal" the tnc does last a long time on 9 volts it
is quite capable of 3-5 day activity depending on how much you are
active. I would say your choice comes down to this if you have a full
laptop then a baycom would do the trick feeding off the computer if you
wanted more features such as mailbox without computer then the kpc 3 is
the way to go. 73's for now hope this helps (--

2620. local organizations that help people get acquainted with packet radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-09 04:08:06 UTC
From: klopfer@natinst.com
Message-ID: <326vf6$dir@eagle.natinst.com>
Source record: 48065

I'm interested in getting involved in some packet radio and was wondering if someone could tell me what local organizations that I might be able to get involved in to meet people who are using this technology and would be interested in introducing someone else to it.

Also I was wondering if directional dish antennas at the GHz frequencies wouldn't be best to provide for reuse of bandwidth and use of less power.

Thanks.

mike

2622. Need some help with the design of an Operational Amplifier

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-09 05:16:14 UTC
From: christos@kuhub.cc.ukans.edu
Message-ID: <1994Aug9.001615.70243@kuhub.cc.ukans.edu>
Source record: 48067

hello there,

I have a question concerning design of a simple amplifier using
operational amplifiers. I am simply designing a noninverting amplifier with a
gain of 2, that is R1=R2 (Closed Loop Gain=(1+R2/R1)). No matter what I apply
to the input of the amp the output always saturates to -11 Volts. Even if no
input is applied the output still gives a -11V.
The voltages that I am applying to the Vcc+ and Vcc- of the op amp are +12V and
-12V respectively. I am using the LM 741 opamp for this application.

Does anybody in this group happen to know what the problem might be?

I would appreciate any relevant response.

Please e-mail.

Thanks in advance

Chris

Direct sequences are easy to figure out. (These are single shift register
generators.) If you know how long it is, say N stages, all you need is N+1
bits to figure out the code and the synch.

There are many users of this amazing program in the UK. It must be the cheapest way of getting onto packet as an old C64 costs less than a third of the price of the cheapest new TNC in the UK.

Mark, your digicom modem presumably plugs into the cassette port of the C64? Have you checked that the cassette interface still works by reading a program off cassette? If this works then the modem is probably to blame. I can't think of any software settings that might prevent reception.

If you are interested in replacing your Digicom modem, I can thoroughly recommend the design by N4PLK which featured in Ham Radio Today I think in 88 or 89 (I can be more specific if you are interested). It cost me less than 20 UK pounds to build and uses the TCM3105 chip which takes its power frow the cassette interface and measures only 3" by 2". It is a similar design to the baycom modem.

>567? I'm looking for something fairly simple; the digital output will be
>sent to a Z-80 SIO for further processing.

The 567 has too much "bounce" and is too slow for most data use. The
565 could be coerced into working, but you'd be better off using a
chip designed for modem service, like the TCH3105 or AMD7910. Actually,
the TAPR circuit with the Exar chip is probably the best *simple*
moden. However, for HF, you'll get the best result with a filter type
demodulator with tracking slicers and soft decision circuitry. (Or
blow the big bucks and go DSP) Irv Hoff's RTTY demod designs still
work well.

HF suffers lots of impulsive noises, selective fading, and interference.
Filter demods with tracking slicers and soft decision circuits still
do the best job of coping with all the channel defects.

Can't help with local groups, but I'd suggest joining TAPR.

>Also I was wondering if directional dish antennas at the GHz frequencies
>wouldn't be best to provide for reuse of bandwidth and use of less power.

Sure is, if you can get line of sight paths. There's plenty of bandwidth
available for really high speed transmission too. The problem is getting
the paths. Most packet networks are sparse, requiring long links, and there
aren't always suitable high sites available for relay.

yes... I reported this late last week... and am still researching it. My
phone though, is the Tropez 900 DL which is not spread-spectrum but
digitally modulated on single carriers within the 900 MHz band. What I
have found is that there is some leakage of in-the-clear audio in the
430 MHz amateur band from the handset. Others have found and reported
similar signals. I am trying to get someone from VTech (the manufacturer
of the phone) to discuss this with me... but they seem to be having trouble
returning my calls.

2633. High speed packet economics / practice questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-09 19:40:06 UTC
From: msimon@CS.Stanford.EDU
Message-ID: <328m2m$el6@Times.Stanford.EDU>
Source record: 48075

I recently attented a meeting of local Hams who are trying to
set up a high speed digital packet network. In discussing this
project the following issues / questions arose:

Most of the motivation for higher speed networking stems from
the fact that 1200 baud packet here in the bay area is congested
and slow. How much are most people willing to spend to get
better or comparable performance to a phone line & a modern modem
(i.e. 28Kb/sec)?

What do people like best about packet networking vs a vanilla phone BBS?
No dependency on phone access and associated fees
Mobility - i.e. digital networking from a car

What do people use packet networking for?
BBS access
Kbd to Kbd QSOs
Electronic Mail
Potential internet access

Finally how much use is there of > 1200 baud packet - I have heard of
the Grapes 56Kb modems - What is the common experience in terms of practical
throughputs, congestion and equipment prices? How much infrastructure exists
at these higher speeds?

Any inputs / opinions would be greatly appreciated. I will post a summary if
I get enough comments.

Thanks
Marc Simon KE6JAF

: That leads up to my plea or question for you whom know out there.
: I would like to know where I can find information on how to hook
: this unit up to a RS232 serial port 1 or 2 on my computer. I also

The HD-4040 is a TNC-1 clone. You can use any standard phone modem cable to connect to the TNC - the pin connections are the same. There should be a female DB-25 for the computer connection, and if memory serves, a db-9 for radio connection.

: need to know where I hook the radio PLL, PLL audio and rec audio,
: and maybe even the ground. Also which Jack I use in the back of
: the unit to hook the computer and the radio.

I don't have a TNC-1 manual any more, so I can't tell you the pin-out for the radio connection. Also, you did not mention what kind of radio you are planning to use.

I also need to know
: if it will operate Kiss mode or Host mode, Host mode is prefferred(?)
: I need a copy of the commands which the unit will accept and what
: the meaning of the commands are.

This will depend on what firmware is installed. The original TNC-1 firmware did not have a host or KISS mode. Firmware was written by WA6DED for it that does have host mode (DED host mode, of course). There also exists an EPROM image for a KISS-only capability. I think TAPR still offers the DED EPROMs, and they also have some form of kit that allows you to upgrade a TNC-1 into a TNC-2, i.e. a daughter board that adds the Z-80 logic and capabilities, while using the existing modem and connectors (I think).

: If all else fails I would like to know where and if an instruction
: manuel is available. If someone out there happens to have a manuel
: and would copy it for me I would be more than happy to pay for
: the copy cost and shipping......Thank you much in advanced...73's

TAPR may also still have a manual.

: Brad

Consider carefully how much you are willing to spend on this project, since there are brand new TNC's available that have these capabilites in the 130 USD price range.

: brad@ecst.csuchico.edu

Hope some of that info is useful. 73

: I want to get started in TCPIP and need an address, among other things.
: Thanks

Here's information I got via smtp mail last summer from one of the fellows
in Tri Cities getting started on TCP/IP:

> Mail corrections or requests to KD7RO @ WB7DOW or
> internet mail; king@mail.boi.hp.com pr
> Prodigy @ TSKC42A (Steve King)

: Bob, KG7WC
: (Eastern Washington)

I've not heard of much amateur TCP/IP activity in Eastern WA - we've got
about 50 active stations here. I wish you luck, and see if you can get a
path to AA7AE going via Net/Rom - I know he'd really like to find more folks
over there to work with. Also, the group over here (and N7HHU in Yakima)
are looking at a number of ways to get connectivity between Central WA and
Western WA. If I can help, please feel free to email me at my 'eskimo'
address. Our amateur <-> internet gateway is down right now, so sending to
the 'ampr.org' address won't go anywhere.

: Jim - N4WFP

I too keep a model 100 for portable packet - it and my Paccom Tiny-2 modified for low current drain and with a voltage regulator with low overhead means I can run both on the same 6V power source. I keep both in a foam-padded pistol case along with RS-232 cables and radio cables for the radios I'm most likely to use portable. I also have spare batteries for both stored away. I used this setup about 5 years ago while providing communications support for a bike ride from Seattle to San Diego, and provided NTS message transmission capability to ride participants by collecting messages and storing them in the computer. When I got in range of a PBBS (almost every night) I'd upload the messages from the file system in the model 100 to the TNC, and the messages would be on their way. I got pleased feedback from riders who later called home (or where ever) and were told the message had been appreciated and an unexpected pleasure. So - yes - the model 100 can do packet, and with a little practice, can do an darned good job. Also, for emergency operations, there is a mini-PBBS program for the model 100 - in several flavors depending on available ram and the availability of a disk drive - if I remember right. It's been a few years since I went looking for that program.

Wasn't one of the main purposes of spread spectrum to make it harder to jam a signal? The encryption is just ancillary, and not that good? The encryption only becomes secure when you use a one time pad...right?

Mike

I suppose we ought to get the obvious ones out of the way first....

You have got the feedback resistors connected correctly? Output to the
inverting input and the inverting input to 0V. The non-inverting input
should be biased to live at 0V unless pulled off by the input voltage.

Hello again everyone,

I thought I'd ask this question simply and to the point.

What's your favorite algorithm for ham-related DSP? What have you found
works best for CW, SSB, AM/FM, Data modes?

Most importantly, what do you wish you had on your DSP?

As always, I look forward to comments/suggestions/info that you can send me.

From: micah@solano.community.net
Message-ID: <32a24o$qad@solano.community.net>
Source record: 48088

I'm into long distance packeting (don't know what to call it)
and I've gon as far west as Colorado Springs (thats what the node told me
when I accessed the Information command). I would like to have the names
and calls of the nodes in and around St. Joseph Mo (bbs would be nice
too).

I do my packet from an old XT using a bayPack tnc and the soft
that came with it, hooked into the Radio Shack 2m HT. I'm planning to go
on a trip soon accross country to Missouri (St. Joe) and I plan on taking
my tnc and 2m rig with me and do a little packeting from there.

A question:

The COS node in colorado. Is it hooked into the internet? There
was a command called Telnet on its command menu when I hooked upto it
last. I'm just wondering.

73's from KD6PJM

Ps. I appolgize if I have made any mistakes in the information I have
given in this post.

Arrrgh! You're a digi Dxer, the bane of network existance. :-)

Really, we've spent a lot of time educating our users to stay on
their LAN and let the network do the forwarding. All it takes is
a couple of digi Dxers accessing a distant BBS to bring a 1200 baud
trunk to it's knees from retries and collisions.

We are building more robust and capable network links, so digi Dxing
should eventually become too boringly easy to attract your interest.
Until then, keep in mind what you may be doing to the forwarding
network by digi Dxing, and try to control the impulse to download
files from distant systems. Get the copy from your LAN BBS instead.

In a previous letter by Matt/N8QNW he requests a cable from the HT to Kam+.

The pins and other connections are the same for this HT and Alinco DJ-580. You can call AES or HRO tech support for these pins(sorry I don't have the number handy).

Good luck on the cable. MFJ may also make one, look in AES catalog for a premade cable. They are easy to make, I made mine for about $2.50 with parts from the greatest electronics store on the planet RADIO SHACK :) . Last four digits are out of stock, but they can order them for you.

will
leave the TNC open so that the buffer fills up and no connects can
happen. Having the ***SAME*** version for the Kantronics TNC (KAGOLD)
for use with the KAM+ and the KPC models and using the ***SAME***
computer
WITHOUT ONE problem at any time and I can leave it without
worry
PKGOLD I can not do that at all. (also tried it on other computers
with the
same results)

One other problem I have notice is that opening a connect window it is
full of junk chars which should not be there. ?????????? (PKGOLD ONLY)

Interfex claims it doesnt have any problems and thinks it mine. Why
can
I run the same versin for the Kantronics TNC without any problems but
yet I can not run the PKGOLD (extra cost) with the AEA products.
(PK-232, PK-88, PK-96)

Also how many commercial programs leave out the manual because you
have it
with your other versions of gold

Has anyone seen or have the so called DUALPORT PKGOLD yet.

But here in the O.P.E.N. network we encourage folks to play around
any way they want. DXing BBS can be fun (and that's what the
network is for - to have fun). Once you get to the Idaho nodes,
you can get to us here in the Portland Metro area. Lots of nodes,
lots of bbs, a linked RoundTable server that ties ten nodes together,
and you are certainly welcome to network on in and play.

Oh yes: O.P.E.N. means "Oregon Packet Experimenters Network",
and our motto is "Do anything you like, any time you like,
for any reason you like."

Arrgh! Your'e a network god, the bane of ham radio!

I think I read somwhere that ham operators were supposed to help fellow amateurs and give contructive guidance and suggestions. I'm glad to see that there are folks who can ruthlessly slam their fellow hams!

Micha, it is fun to see how far you can link your system, and then maybe send a CQ from the node you connect to and try to talk to somebody. Generally, however, you should not connect to any BBS that you cannot directly connect to. There are also many freqs and nodes which have been set up for keyboard to keyboard QSO, and you should avoid putting BBS traffic on or thru them. Keep in mind that every piece of information that is sent to you has to go through all the nodes you have connected to, and if it's a lot of data, it is possible for you to slow down all the LANS you are passing through. With reguard to the telnet question, what you probably connected to was a system which is running KA9Q NOS, which is a TCP/IP implementation for amateur radio. It has the ability to be configured as a NETROM switch and TCP/IP station/switch. The telnet command may allow you to gateway into that nodes local TCP/IP LAN. Keep in mind that there are hams around who are willing to help, so keep on askin' questions!

Happy hamming!
Scott Santana - N6SPB

2653. Basic questions

Newsgroup: rec.radio.amateur.digital.misc

I have a few basic questions

1) What frequencies are used for packet?

2) Can a computer/packet modem/radio make a true connection to the internet,
to connect to e@mail, telnet, etc?

mgalatz@panix.com

2654. Smallest MultiMode TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-10 23:00:47 UTC
From: newmedia@teleport.com
Message-ID: <newmedia.12.0017040D@teleport.com>
Source record: 47946

Please help me find the smallest multi mode TNC available. I am provisioning a 40' sailboat for a ham friend for a several year cruise. Space is at an absolute premium. He'll be operating exclusively HF through a modified ICOM M600 SSB marine transceiver. So 300 baud max is fine. Required modes include Packet, WeFAX, NAVTEX, RTTY, CW. PACTOR, G-TOR and SITOR would be cool but not mandatory. Cost is a secondary consideration. The size of most units I've looked at are just not acceptable. Ideally, we need something about the size of a new Supra modem (about 1" h by 5"w by 7" deep). Is there such a beast. I'd appreciate any help.

>mgalatz@panix.com

The frequencies depend on what area you live in. In michigan (where I live)
most TCP/IP packet activity is on 147.56 but cross the state line and it
changes.

The answer to question #2 is yes. By using NOS to tell your PC how to "speak"
TCP/IP and how to use your TNC in KISS mode you can. However in order to
become part of the Internet over the air you need to have a packet-radio <-)
Internet gateway that you can reach. You can use digipeater, NET/ROM nodes,
tcp/ip switches, ROSE switches or whatever else you need to get to it
because NOS can encapsulated TCP/IP in to jam ip packets through just about
anything. The sysop of the gateway I use allows us to connect to anything on the Internet
because he's a nice guy and we don't abuse it. Some sysops
opnly let you connect to other amateur systems (IP addresses 44.xxx.xxx.xxx with
in the ampr.org domain) but that depends on your sysop.

Hope I've been of help.
Nate

2658. Looking for MC13055 FSK chip

>for any reason you like."

Hmm...and all these years I thought that was Woodstock!

Seriously, Hank, I don't think there are many areas that can (do)
support that sort of operation. It's a nice thought, but rarely
found.

Around here, the network was built by the BBS people to support the
BBS traffic. The population won't support much more than that. DXing
nodes is actively discouraged. I'm not saying it's ideal, or
desirable, just reporting the facts. After nearly 8 years of being
the sole support for the local "network", we are finally getting a few
more people interested in something more exotic. Improvements will
come, but they will be very slow.

Gary

2660. Jnos Config with E/Net card

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-11 08:50:49 UTC
From: ee17@csu.napier.ac.uk

Source record: 47958

Has anyone managed to configure Jnos v1.10xx to work with an ethernet card.
The cards I have in mind are NE2000, WD8003 etc.
Sample config file would be very much appreciated.
I have tried using the clarkson packet drivers and using the Attach packet
command without any success.

According to the AT&T owners manual, The security code changes
automaticly when the phone goes off hook. I think this would make
it diffult to crack the code!

>commercial software. If anyone has any information or pointers, please send
>them to me, or post them here. We are really looking forward to getting
>this online here.
>
>

There is no shareware version of DX PacketCluster. At one time, I think that
MSYS tried to emulate PC operation, but I am not sure that works any more.

You can buy PC from K1EA Software 508-779-5054 or FAX 508-460-6211. They
have a BBS at 508-460-8877 which can give you more information. The current
cost is $200 or $300 and major release updates have been $100. Incremental
updates are free except for the cost of the phone call to the BBS.
We are now at release V5.4-48 (or 49) and I had to pay the upgrade fee when
we went to V3. V4. and V5. (that was 2 years ago, I think). The cost for
PC is really quite reasonable for what it provides, and it is a minor
amount considering what one has tied up in computer/radio/tnc/antennas/etc.

In central IL the problem is much the same; a couple of us are supporting
the entire network, such as it is. However, I agree with Hank. We should
let people play around so that they will become interested and may want
to contribute $ or labor. The DX cluster network is a big as it is because
DXer's will support something that helps them enjoy the hobbly. DXing
nodes could be the same. A couple people trying to transverse the network
is not going to effect overall performance. Let them have some fun!

> 73's Adrie.

Yep, I use the Mac Packet Modem, which was featured in the September '92
(I think)
issue of 73 Magazine. It's pretty much a BayCom-type modem with no
external power,
TCM 3105 modem chip, etc. The software is SoftKiss, a control panel.
Then you
run a program that expects a KISS modem on the end of your serial cable,
like
Net/Mac (TCP/IP) or Savant (Cool Packet-oriented terminal program) You
could
buy the Modem kit for $35 or so, then SoftKiss and Net/Mac are free, or
Savant is
like $39-49, if I remember right. SoftKiss, Net/Mac, and Savant Demo are
all
ftp'able, but you get some of that with the kit.

This won't do HF packet, or any other mode except packet, but will do
great
on portable VHF/UHF packet with a PowerBook :-)

Send me a message and I'll see about getting some info to you...

2666. PK-88 to Kenwood TM-231A interface

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-11 14:44:42 UTC
From: JAY@medicine.dmed.iupui.edu
Message-ID: <JAY.40.2E4A395A@medicine.dmed.iupui.edu>
Source record: 47986

Last night, I built a cable to connect my PK-88 to my TM-231A. I don't have the pin out here, but it was quite simple.

Unfortunately, the DCD lite on the PK-88 stays on when the radio is squelched. Because of this, the PK-88 will never tell the radio to transmit. It receives fine. If I am tuned to a repeater and there is no sound coming through the repeater, then the DCD lite is off. I'm kind of confused. This PK-88 has been hooked up to my Icon IC-28H for years with no problems.

Has anyone else seen this problem, and solved it?

Thanks
Jay

|> come, but they will be very slow.
|>
|> Gary

The situation here is much the same ... or rather most of the folks who are building the network also run their own bbs, and most of those bbs

ARE the network nodes. My system, for example, has two 9600 baud ports which support point-to-point links between major subnets, two 1200 baud ports that support point-to-point links between minor subnets, two ports specifically for user access. Most of the other systems are 4-6 port systems - gathering the gear together like this and providing multiple paths between any two points results in a very robust network. Were my system to go off air, everything else would still be connected.

In this area the "BBS people" understand that their sole purpose in life is to have fun while doing the best job they can serving the "users". "users" are folks that have not put tcp/ip or their own bbs on the network YET. They will do so eventually. We do get lots of questions like "Is it ok if I download this 100k file at 8 PM", but folks rapidly figure out that it IS ok, and in fact is encouraged. The network is set up so doing things like this do NOT impact the other users very much, and in fact work just fine.

So we have these few simple guidelines like the "Do anything you like ...", and "A packet must never leave a node on the same port it entered" and "A backbone link freq has two radios, but can support three in emergency" and "Don't put the nodes on the TOP of the mountains." Mostly just common sense stuff which, when you do it, makes an excellent network.

And yes, we DO have problems, but then we all work together and solve them.

It's really kind of simple ...

... Hank

No, but the recent releases of my packet software include RT, which
will probably do exactly what you want ... it is a chat server
that can link any number of nodes into a single group of chat sessions.

2671. PACTOR/AMTOR subbands...where?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-11 17:00:57 UTC
From: jal@rational.com
Message-ID: <1994Aug11.170057.10214@Rational.COM>
Source record: 47963

I am still an HF newbie and with the current state of the bands, it's not easy for us newbies. Last night while scanning around what should be the CW portion of the 40 meter band I heard a QSO between an Hawaiian station and some foreign station. Als the Hawaiian station claimed he was going to QSY back to a quiet spot he had found between two AMTOR subbands.

My question are two:

1) How can a Hawaiian, which despite Dan Quayle not understanding is part of the US, transmit phone in a non-phone portion of the band.

2) My only reference for digital subbands is a handbook on digital published by the ARRL. It lists only one subband for AMTOR per band. Are there more subbands. Where can I find a current subband listing? Is the AMTOR subband the same subband as RTTY and PACTOR. I know that there is no such thing as a digital subband but you know what I am referring to.

Thanx

2672. Temperature Telemetry

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-11 17:23:54 UTC
From: oflber02@uctvax.uct.ac.za
Message-ID: <1994Aug11.192354.1@uctvax.uct.ac.za>
Source record: 47982

I am currently doing a thesis on a Perishable Goods Temperature Monitor.
The thesis calls for a temperature probe which is packed with the goods.
An interrogator then interrogates the probe and a reading is given.
The problem is that the probe is not allowed to have a power source at all.
The interrogator is hand-held and is powered by a battery. An option is
to have a rechargeable set up.
The probe must be as light as possible and as small as possible.
The system must be able to read temperatures between 233K and 313K
with an accuracy of 0.5K
I have thought about using a telemetry system or a transponder.
I have thought about using magnetic, acoustic, RF or microwave coupling
but I do not think I will be able to get enough power from a meter away
to power a IC like the LM35.
The interrogator must be able to receive the temperature from a meter away.
The only thing I have thought of that might work is an oscillating circuit.
The oscillation frequency changes with temperature.
A dip meter is then used as the interrogator.
The only problem is that the only thing I can think of that will vary with
temperature is a bimetallic strip.
The strip can then be used to change the capacitance of the oscillating
circuit.
However I need a circuit for a dip meter which can constantly scan the
frequency range and be able to differentiate the dips so that the required
accuracy is obtained.
Any help or ideas and suggestions are needed and very welcome.
Please send mail to
oflber02@Uctvax.uct.ac.za
Thanks in advance

Hi,

Does anyone have any information on packet data switches (ie manufactures, phone numbers and models)? This switch would be used in an amateur packet radio set up. I have heard of Gracilis but after making two attempts to have them send literature out and still not received any I am going persue my quest with another company......

Thanks

Ken

2678. Packet BBSs for Unix?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-12 03:00:27 UTC
From: knauer@ibeam.intel.com
Message-ID: <CuEJ0s.9zF@ibeam.intel.com>
Source record: 47967

Greetings all.

I'm relatively new to the packet scene, so if this is an obvious question, please forgive.

What I'd like to find is code for a packet BBS that will work on a Unix box (specifically, SunOS on a Sun 3/60). Provision for either BBS operation or direct login (sort of a packet getty) would be fine; from that point I could hack the source either way.

Does such a creature exist? If not, do any of the common BBSs for the PC (W0RLI, etc.) come with source? I'd like to avoid starting from scratch if at all possible.

[The next obvious question is if there already exists a packet->UUCP gateway, but I'll save that for when I have spent more time goofing around with packet in general...]

Thanks,
Rob

My two cents: I use my old TRS-80 Model 100 for portable packet operation. Just the last weekend, I was operating portable picnic packet, when I ran out of juice for my 386 GRiD laptop. I did bring the M100, and four fresh "AA" batteries. I switched the RS232 cable, and didn't miss a packet.

Signed,

Just using M100 Built-in Terminal

Hi. We have a problem with a Mac serial port controlling a PK232MBX:
My father, WA7JHA, used PacketGold v8 with his AEA PD232MBX on an IBM
286AT clone for years.

Now he has upgraded to an Apple Macintosh Quadra 610 DOS machine which
has a 486 chip
on board with DOS 6.0 and it runs the PacketGold software just fine.
However, he's having
trouble - in fact it isn't working at all - getting the software to
interact with the PK232
via a standard Hayes modem cable for the Mac, via the Mac modem serial
port.

The PacketGold software reports: "Turn the modem off" and when he
complies, it reports
"Unable to find modem on any serial port.."

We have written to Apple, Interflex, and AEA about this, and are
waiting for responses.

We have Zterm, a basic terminal application for the Mac, but this
doesn't make the PK232
respond either.

Who has run the Quadra 610 DOS with packet, and how did you do it?
If you're using
a DOS 486 card on a Quadra 610 (or any Mac) to control a serial port
device, how is it working
out?

Please contact me via internet, (post a response if you like, but
please email directly to me as well) with suggestions or comments
regarding System 7 applications for packet on Macs
or his specific problem.

If you have a suggestion for who else to contact about this problem,
please speak up. Thanks.

Thanks for your help and 73.

Joe,

I can't answer the first part of your question; but I can tell you where you'll find the digital modes on 40 meters. From about 7.065 to about 7.070 you'll hear alot of AMTOR. A G-TOR station or two will hang around 7.070 to about 7.072.
PacTOR freely takes up the spectrum from about 7.073 to about 7.080 or there abouts. At 7.080 to about 7.090, you'll hear alot of plain ol' vanilla RTTY. Above there you'll hear HF packet.

Good luck and have fun!

I have received alot of replys concerning my last posting
concerning my Packet Habbits. The reply are evenly matched for and
against such activitys (see previouse post).

I would like to say a few words on my behalf.

I am aware on the fact when I do this activity I do tie up nodes.
So I do this activity lat at night usaly starting around 00:00hrs pac.
and some time go as long as 05:00hrs pac. I do this at theise times for
two reasons: 1, there is little packet communications going on in my area
at this time. 2, I run low power and often get stomped on by higher
powerd stations durring the peek hours.

There has bein the comment to call out CQ when I get to a new
node, I've tried that but usaly no one's up that late.

If the owners of the nodes think I'm a nucence they can kick me
off, thats their perogrative. Usaly when I get out far enouph I usaly
time out some where along the line anyways.

I node hop like this becuase I like to see how far I can get if
need be. and I usaly set a goal in seing if I can get to a certain city
(current one St. Joeseph MO, I have family threre).

Thank you for your responces. Some of them I found quite
entertaining, I'm glad that they were all polite in wording.

-Micah-
KD6PJM

Ps. The question concerning if there were node or bbses in or around St.
Joeseph MO was never answered.

> a beast. I'd appreciate any help.

Although I can't directly answer your query, I'll take the time to point out something that you must consider: Most commercial/marine HF transceivers will NOT accept the standard "high" tones 2110/2310 used by the amateur community due to the required audio rolloffs when operating in a 2.5 kHz channelized environment.

Check to see if the M600 has a "direct FSK" capability so that you can run with TTL or RS232 connection to the TNC instead of audio. That is by far the preferred method and eliminates problems with AC hum, alternator whine, or ignition spikes on the interconnecting cables. If you can't run DFSK, be ABSOLUTELY sure that the multi-mode unit you purchase offers FSK tones in the 1200-1800 Hz range or you will have MAJOR problems.

I don't have the CCIR or CCITT list of worldwide standard tones handy, but I recall 1300/1500 and 1410/1590 both being common. In any case, you get the point, especially if your friend's life might depend on this comm gear at some point. We all want him back alive, especially if he will be rare DX during the trip!!

I would like to find out how to modify my Alinco DR-600T (2m/440 mobile) to be capable of low-speed (300 and 600 baud) FSK modulation. I am playing around with some used pagers that have been recrystaled for the 440 band, and I need to encode & decode FSK. I'll be using A/D and D/A converters to generate and decode the signal. I just need to be know how to get directly at the discriminator, and varactor, of the DR-600. Can anyone help me out?

Not that new, try Dxing repeaters and see what kind of ire you raise when you key up several at once again and again. Packet and repeaters are both service oriented rather than DX oriented. The idea is to provide *reliable* service to a designated area, not to support freak long distance comms.

>I agree that people should use their closest BBS, but there shouldn't be any
>problems with people node hopping to see how far they can get! Experimenting
>is what ham radio is all about, isn't it?

Experimenting is fine, trying to *use* the systems in realtime more than 3 or 4 hops away, however, is just asking for trouble. You're going to retry out, and in the process probably crash someone else's forwarding session. With a little care, just probing the network out of curiosity won't hurt a thing. But the current state of the networks simply won't support actually trying to *use* the network in realtime over many hops.

Hopefully that'll change some day soon as we bring up faster hardware, find more reliable paths, and switch to more robust network protocols. For right now, however, the VHF network is very delicate in many areas. About all it can support is closely controlled timed forwarding of traffic from BBS to BBS.

: Mike

Spread spectrum was not developed as an encryption scheme. The
properties that makes it desirable are :

Protection against jammers. This is measured in the AJ (anti-
jam) ratio. Some simple math shows how much more jammer
energy is needed to cause bit errors(digital communications)

Low probability of intercept. SS signals can be placed below the
noise floor in many cases. This means that covert operation
can be conducted with some communications.

Most people confuse the encryption with the last one. If the method
for spreading and the code is known, a little bit of work will show you the
signal. For more information I believe Sklar's "Digital Communications" has
a chapter on it. This was the text that was used when I took a class on this,
and it seemed pretty good.

Try to keep 7.080 to 7.090 for Baudot RTTY. The space below the RTTY section is where people do Amtor/Pactor/Gtor. The space above the RTTY area is where packet is commonly run.

On 20 meters, 14.065 or so to 14.080 is where the Gtor/Amtor/Pactor modes are used, the 14.080 to 14.090 space is for Baudot (and you'll find a lot of DX on Baudot in this space) and above 14.095 is where there's a lot of packet.

Layouts are similar on other bands... The fully automatic HF NPRM will likely cause a shift in where the packet signals are, since they'll be in limited subbands (along with any other mode being run full-auto) once that NPRM becomes part of the rules.

2691. Windows 3.1 and Baycom Modem TCP/IP networking

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-12 17:08:06 UTC
From: ei938@cleveland.Freenet.Edu
Message-ID: <32ga9m$f1n@usenet.INS.CWRU.Edu>
Source record: 47977

Packet Radio Folks,

I have a question regarding Windows 3.1 or WFW and ham/packet radio: Is there a Windows or WFW driver available for the Baycom packt radio modem that would allow TCP/IP networking functions over packet radio?

I understand that Windows 3.1 or WFW can use TCP/IP networking with the WINSOCK.DLL. This provides TCP/IP networking services to an Windows TCP/IP application. Whatever networking medium used requires a driver, ie SLIP/PPP, ethernet, token ring, etc.

Ham/packet radio also uses TCP/IP as a protocol in local area networks. I have a Baycom modem and plan to use the AX.25 driver withthe DOS program KA9Q NOS to access the local TCP/IP packet network.

My question is: Is there a way to tie the Baycom modem into Windows 3.1 or WFW? You could then use the TCP/IP applications over pacet radio just like you would over an ethernet or SLIP/PPP, only much slower. I think you would need a packet driver like the etherne cards require.

Has anyone got any information on this? If I get any responses, I will combine and post to this list.

THANKS IN ADVANCE!!

Andrew Lynch, N8VEM
alynch@wpgate1.wpafb.af.mil

PS. I have searched the ham/packet FTP archives for this and did archie searches as well, with no luck. I suspect nothing like thi exists. I realise this may be esoteric, but I think this would be one very interesting technical project. If there are any ham/paket radio enthusiasts looking for a challenge, who are also Windows expert programmers, this project may be for you. This project pobably would require programming experience writing windows drivers therefore this is WAY out of my league.

There are DOS programs which do this in existence, with source code, so I think its *theoretically* possible. If Windows WINSOCK.DLLprovides the TCP/IP services, I think all thats needed is a Windows packet driver for the Baycom modem. The Baycom AX.25 driver forDOS (NOS) includes documented assembler source code, but no doubt a Windows version would be VERY different.

Send me email if you would like to discuss more.

73!!

From: geoff@sun-12.cae.wisc.edu
Message-ID: <GEOFF.94Aug12125906@sun-12.cae.wisc.edu>
Source record: 47978

This may be a series of FAQ's, and if so, I would gladly read a FAQ list if there is one. Please point me to it.

I am writing on behalf of my grandfather who has just recently passed his ham radio test and is awaiting his call letters.

He has become very interested the notion of packet communications but knows nothing of the "science." He called me because I am at least computer literate, but unfortunately, I am ham radio illiterate.

I was hoping that you could help educate us both. Specifically, what hardware is required? Actually, lets step back a bit. What is packet radio used for? Is it strictly for point to point chatting or file exchange or can one actually run a BBS on it? I really mean it when I say that I am illiterate.

What does one use to talk to tranceiver? Does a simple serial communication link do it, or does one need a special modem? Will a dumb terminal suffice or does one need a cray super computer?

Tell me, what does packet communications give that Internet doesn't?

Thanks ever so much for your help . . .

Unless, of course, the area you are in has a reasonable network.

In this part of the country, you can reliably connect out to 8, 10,
or sometimes even 14 hops. Up to 8 hops you can even "use" the services
you find at the end of your path, nearly as well as if they were a
couple hops from you. So it really depends on whether the folks who
built the network did a good job of building it ... or not ...

This statement is certainly not true of the networks in the NW states ...

: at this time. 2, I run low power and often get stomped on by higher
: powerd stations durring the peek hours.

Hi Micah... you sound just like me! I frequently stay up all hours to just DX a chat along the line someplace. I've gone from Central Georgia to COS and RENO and WashDC, in the past and even chatted with folks in RENO and DC. I've chatted with somebody in Cape Girardeau MO, so I know there are nodes and or ROSE switches out that way. Of course I *cheated* going to RENO, there's a quick gateway from Alabama to there, so I only do 2 node hops to get there and one of those nodes is mine. :) I do make it point thou to never use a remote BBS.

The link to DC (Virginia) was on a network that only allows DX chatting, and absolutely nothing else, very fast late at night and early morn. That net has no gateways to any other net that supports any other traffic. Its against their charter, its not that any of the guys hate BBS's, most of them also support a separate net for BBS'ing. And some of us are setting up a DXCluster trunk soon. Sheeshhh ... too many parallel trunks! Yet another topic for discussion.

Ever try REAL DX on packet... when the band is open try 1200bd on 10 meters! Mega-fun! Come to think of it, I think that's how I went to COS, thru a 10m gateway someplace (AZSE? or Denver?). I used to live near the COS stack, so I wanted to try some old friends.

Well 73/bob

Does anybody know of a construction article for a "general purpose" TNC?

These are my reguirements:
1) Standard serial connection. (I have 4 different computers and would like to be able to connect to all).

2) An internal processor of some type to minimize the overhead on the computer.

If these are too strict, please let me know.
Thanks.

Hello again everyone,

I was wondering if you knew anything about the Widrow-Hoff LMS algorithm that was used in Sept. 1992 QST's article "Low-Cost Digital Signal Processing for the Radio Amateur". Appearantly the LMS algorithm is nice to use to cut out signals that are repetetive when listening to SSB (you wouldn't use it for CW- cause all you would hear instead of the morse code was a "click" evertime a new tone came buy :)

Appearantly this algorithm is used in the HumVee's to stop engine noise in the cabin. (I think there are other car companies working with it to reduce second-order boom in 4 cylinder cars).

If you know where I can find this algorithm or further information about it, please let me know.

TNX et 73!
Allen Hall n9rzc@uiuc.edu

ps- as always, I look forward to any and all comments that you may have concerning this posting.

>
>Packet Radio Folks,
>
>I have a question regarding Windows 3.1 or WFW and ham/packet radio: Is there a Windows or WFW driver available for the Baycom packt radio modem that would allow TCP/IP networking functions over packet radio?

The problem with Baycom and Windows is that Baycom is dependent on
precise processor timing to do bit banging, and heavily uses interrupts.
Windows is a *cooperative* multitasker that doesn't do a good job of
protecting memory and often doesn't allow precise timing because of ill
behaved applications or heavy loads. So you get either very poor performance,
or even hangs and crashes when you attempt to mate Baycom with Windows.
If you must run Windows, a hardware TNC will give much fewer problems.

MS>Can anyone steer me into info on how to get started with packet radio
>with a 486 clone?
>---

Hello Mike. You have the main thing needed for packet radio. Just
get you a tnc(terminal node controller) and a two meter radio. a
Handy talkie works well, or you can use a mobile rig. Most use HT's
because they are less expensive used. You need to get software for
packet. If you use Procom, it will work very good. You just set it
up in the dumb terminal mode. Then get the manual out for your tnc,
and start programing the commands you will need for packet. There
are many programs out there, but I would suggest using a dumb
terminal for a while to learn the commands and kind of get familiar
with it. I use a Tandy 486 machine, and it works very well. You
don't have to have too much to run packet, as it doesn't take much
memory to run it. If you have anymore questions, please let me
know. Cul....Mike, KE4CLE

I've been noticing lots of requests lately for info on medium and high speed packet equipment, and several times I've mentioned a file available to ftp. Of course, its been pointed out to me that not everybody has ftp access. So here it is, all 27kb of it! Please if you further distribute it, don't make any changes! This file is maintained by Barry VE3JF.

Blame me for filling up your newsreaders! :) 73/bob ka4byp

Equipment Options for Medium to High-Speed Packet

Compiled by Barry McLarnon, VE3JF

Last update: 28 July 94

The purpose of the following is to summarize the hardware options available for constructing medium- to high-speed packet radio links. The speed range in question is 9600 bps and up. This material is intended to be a useful reference, but I make no claims as to its accuracy or completeness. Some details concerning model numbers and prices are missing, and I have very little information concerning equipment sources outside North America. If you have corrections, or suggestions on additional information to include in this survey, please send them to bm@hydra.carleton.ca (or ve3jf@va3tcp.#eon.on.can.noam).

This material is released to the public domain. You can do what you want with it - all I ask is that you retain this notice and attribution if you reprint it in whole or in part.

Note: unless otherwise noted, prices given are in $US. They should be considered only as approximate.

Equipment for 9600 bps
~~~~~~~~~~~~~~~~~~~~~

9600 bps Modems
~~~~~~~~~~~~~~~
The K9NG modem was available for a number of years as a kit from TAPR. It set the "standard" for 9600 bps packet operation, but it has now been replaced by the G3RUH and new TAPR designs. Among the improvements provided by the newer designs is full-duplex capability. Even when full-duplex is not needed on the air, this is a great convenience for doing loopback testing of the modem. If you still have a K9NG modem lying around, though, don't hesitate to try it.

The G3RUH modem is available from several sources:

PacComm MC-NB96 internal modem card ($115) - fits on disconnect header of most TNCs.

PacComm EM-NB96 external modem ($149) - standalone version of above.

Kantronics DE9600 modem card, similar to the PacComm MC-NB96.

MFJ MFJ-9600 9600 bps modem card ($110), similar to the others.

The new 9600 bps TAPR modem kit ($80). The new design has all of the features of the G3RUH, plus a few enhancements. It is attractive for repeater use, since it includes provision on the board for bit regeneration/FIFO buffering ($15 extra for the parts). The first rev of the board in 1992 had a few problems, and some mods were needed for best performance. A new rev which incorporates the fixes became available in early 1993. TAPR members get a 10% discount on purchases.

The G3RUH and TAPR modems can plug directly into a TNC modem disconnect header as a daughterboard, or be connected externally via a ribbon cable.

DRSI DPK-9600 ($250). This is a G3RUH-compatible modem and TNC-2 clone (10 MHz clock) housed in one box.

Data Interfaces for 9600 bps
~~~~~~~~~~~~~~~~~~~~~~~~~~~
For 9600 bps, the usual interface is a TNC. If you don't already have a TNC, it's worth considering a PC bus interface card like the PI2 or the PackeTwin. They are a better investment since they will not become obsolete if you upgrade to higher speeds than 9600. In fact, many people have reported results with TNCs that were much less than theoretical maximums, even at 9600 bps. The faster the TNC clock rate the better: 4.9MHz should be considered an absolute minimum. If you really feel like investing in a TNC, you might consider those which come with a built-in 9600 bps modem: the AEA PK-96 ($200 range), the PacComm TNC-NB96 (listed in their Spring 1994 catalog at $295, but that seems badly overpriced), or the DRSI DPK-9600 mentioned above.

Ottawa PI2 card ($125 plus shipping). It provides a DMA port which handles 56 kbps with ease, even with a 4.77 MHz XT-class machine. All you need to add is the cable to the modem. The main limitation of the card is that it does not support full-duplex operation, but full-duplex operation is rare (especially amongst end users). The PI2 also has a low-speed port and can be populated with an on-board 1200 bps modem (kit available for $30). The board can be used with any DOS version of KA9Q NOS, or with Linux.

Gracilis PackeTwin-PC card ($225). Like the PI2, it provides a DMA port for the 56 kbps modem and an interrupt-driven port for lower-speed modems. The DMA port supports full-duplex operation. The Kantronics 9600 bps modem can be piggybacked on the card.

DRSI PCPA Type 1296 ($290). An interrupt-driven PC-plugin card with onboard 9600 bps and 1200 bps modems.

Radios for 9600 bps
~~~~~~~~~~~~~~~~~~~

A standard NBFM radio is typically used. To interface to the modem, the radio must have a direct FSK modulator, discriminator output, an IF with sufficient bandwidth and reasonable phase characteristics, and fast t/r switching. Some radios are usable with just a few modifications to bring out the required signals, others may need more extensive mods such as adding a varactor FM modulator, and still others are almost completely unusable due to their IF characteristics or slow t/r switching. There are a few radios designed specifically for digital service which require no mods:

2m:

Alinco DR-1200TH (approx. $300). This is a version of the DR-1200T 25W synthesized radio which has been modified for 9600 baud operation.

DRSI offers a "matched set" ($550) consisting of their DPK-9600 TNC/modem and a modified (by DRSI) Alinco DR-1200T.

70cm:

Tekk data radio ($110?), 2W output, one channel, crystal controlled (430-450 MHz). Available directly from Tekk, and in packages from Gracilis and other sources. A recent ad (Feb 94 QST, p 18) shows two models: the "T-Net Mini" at $110, and the "T-Net Micro" at $100. They appear to have the same specs, but different packaging (the Mini is larger, to allow room for options). Other sources refer to models called KS-900 and KS-960 from Tekk, so it is not clear how many models of radio are currently available, and how they differ. Gracilis has a package consisting of the PackeTwin card, 9600 bps modem, and Tekk KS-900 which lists at $520 ($595 if KS-960 is substituted).

PacComm also has a package which contains the Tekk:

PacComm IPR-NB96 ($495): Tekk radio, modem, and Tiny-2 MK-2 TNC housed in one box.

Both Gracilis and PacComm also sell Tekk radios separately.

Kantronics D4-10 ($359), 10W output, two channel, crystal controlled (430-450 MHz). Can go to at least 19.2 kbps.

A large number of amateur VHF and UHF transceivers have been successfully used for 9600 bps work. Many commercial FM radios are also suitable; ironically, the IF filters in these radios are typically 'better' (narrower bandwidth, steeper skirts) than in amateur-grade equipment, which leads to inferior performance at 9600 bps (on the other hand, they also tend to have superior intermod immunity compared to amateur rigs). The IF stages of most receivers can be broadbanded successfully, but the degree of difficulty and expense involved varies considerably.

A good source of information on radio interfacing and other topics related to 9600 bps operation is the "9600 Baud Packet Handbook" by Mike Curtis, WD6EHR. Hard copies are distributed with the TAPR modem, and it can also be found in electronic form on some BBS's. Unfortunately, it hasn't been updated for a long time.

Summary: 9600 bps
~~~~~~~~~~~~~~~~~
The cost of getting something working at 9600 bps is highly variable. If you already had a TNC and a suitable radio plus antenna, it could be as little as $80 or so (TAPR modem). On the other hand, you can get a "plug 'n play" package from Gracilis, consisting of a PackeTwin interface card, DE9600 modem (piggybacks on the PackeTwin), and Tekk radio, for about $500 - just add an antenna. You should seriously question spending this kind of money to get 9600 bps, when you could put together a 56 kbps setup for not much more money (but, admittedly, considerably more effort!).

Equipment for 19.2 kbps
~~~~~~~~~~~~~~~~~~~~~~~

Until recently, operation at 19.2 kbps had not received much attention. A major reason for this is that binary FSK at 19.2 kbps cannot be accommodated by the IF stages of NBFM receivers, nor is it compatible with the 20 or 25 kHz channel spacing used for FM in the amateur VHF/UHF bands. On the other hand, it makes relatively poor use of the 100 kHz channels typically allocated for 'wideband' digital modes. However, interest in 19.2 kbps operation has been spurred by the appearance of the Kantronics D4-10 radio. Since it contains a varactor modulator, plus a data slicer following the discriminator, it can be operated in 'raw FSK' mode at 19.2 kbps without additional modem hardware. All that is needed in addition to the radio is the computer interface. A 'souped-up' TNC might work fairly well, but one of the PC DMA interface boards (or maybe a DataEngine) would be better. Running 'modemless' FSK entails some loss of performance, most notably from the lack of data scrambling, which results in more jitter in the recovered clock signal and thus higher bit error rates.

Kantronics also offers a 19.2 kbps modem, similar to the DE9600. The performance difference between the 'barebones' D4-10 radios and that which you could realize with the more sophisticated modem has not, to my knowledge, been quantified. The GRAPES modem (see below) could also be run at 19.2 kbps, but it would not be compatible with the Kantronics equipment (and why would you want to throttle back a modem that can do 56 kbps and more, to only 19.2?).

Some experiences with using the D4-10's at 19.2 kbps, using Ottawa PI cards and DataEngines as interfaces, appear in an article by John Ackermann AG9V in the 11th ARRL Computer Networking Conference Proceedings.

Equipment for 56 kbps
~~~~~~~~~~~~~~~~~~~~~

56 kbps Modem
~~~~~~~~~~~~~
GRAPES (WA4DSY) modem, $250 in kit form. You also need to provide a box for it, plus a few interconnecting cables and connectors. It requires +/-5V power (about 0.5A @ +5V, 0.1A @ -5V). This is an RF modem with input and output (about 1 mW) in the 28-30 MHz band, designed for use in the bands above 220 MHz (occupied bandwidth is about 70 kHz at 56 kbps),

using standard receive and transmit converters. The receive and transmit portions of the modem are separately crystal-controlled, and it can run full-duplex. It is not limited to 56 kbps - with suitable modifications, it can be made to work at 128 kbps or more.

Data Interface for 56 kbps
~~~~~~~~~~~~~~~~~~~~~~~~~~
Ottawa PI2 card ($125)
Gracilis PackeTwin card ($225)

Both of these cards (see descriptions above) will handle 56 kbps with ease.

Kantronics Data Engine (need price info ~$350?). This is essentially a higher-speed TNC with two HDLC ports that can reportedly run at 56 kbps, and an RS-232 port that can run at up to 19.2 kbps. The standard firmware is KA-Node or G8BPQ, but there is now also a port of JNOS (JNOS40) by WG7J available. The DE appears to be more useful as a small standalone packet switch than as an interface for end users.

Gracilis PackeTen (~$1000). This is a full-blown packet switch that runs a custom version of KA9Q NOS. It is available in both standalone and PC bus versions. This is the Rolls Royce of packet switch hardware. The name is a bit of a misnomer, since one PackeTen provides five ports - you must add another one to get ten ports. All of the ports will handle synchronous or asynchronous rates of 1200 to 19200 bps, and three of them will do sync rates up to T1 or more.

RF Equipment for 56 kbps
~~~~~~~~~~~~~~~~~~~~~~~~
The RF equipment required depends on whether the links are half- or full-duplex. There are three basic configurations in use:

(1) Half-duplex point-to-point links

An example is the Georgia backbone network. The usual RF equipment is a Microwave Modules (220, 430 MHz) or Sinclabs (220 MHz) transverter.

(2) Full-duplex point-to-point links

Full duplex operation is significantly more complicated, but it is also highly desirable if you want to maximize the throughput of a backbone link. The GRAPES modem is inherently full-duplex, so it is only necessary to provide separate RF up- and down-converters. The two channels may be in-band or cross-band, using either separate antennas or duplexers. The only full-duplex point-to-point link I'm aware of is in Chicago - it uses PackeTen switches and operates in-band in the 70 cm band.

(3) Multiple-access networks with full-duplex repeater

In this case, an in-band or cross-band 56 kbps repeater provides hidden transmitter-free access to a channel (or rather, a pair of channels) by multiple 56 kbps stations. This might just be a LAN for the power users, but it also is an attractive means of linking a number of network nodes

together, with less complexity than multiple point-to-point links (see the 10th ARRL Computer Networking Conference proceedings for more details). As in the preceding case, separate receive and transmit converters are used, usually with separate antennas (in principle, a transverter with "split" frequency operation could be used, but such things are hard to come by). The stations in this network do not require full-duplex computer interfaces, but since the RF portions have full-duplex capability, it allows smaller txdelays to be used than in the half-duplex case. It also allows users to observe the quality of their signals coming back from the repeater.

The first 56 kbps full-duplex repeater went on the air in Ottawa in January 1990. The repeater is cross-band (220.55 MHz in, 433.55 MHz out), so users must up-convert the modem's 28-30 MHz IF output to 220 MHz, and down-convert 432 MHz to the 28-30 MHz IF input.

220 MHz (222 MHz in the US!)
~~~~~~~~~~~~~~~~~~~~~~~~~~~
Transverters and up-converters:

Sinclabs ST220-28 transverter ($329 CDN), 15W output. Sinclabs has recently withdrawn from this business, but transverters may still be available from Bob Morton, VE3BFM (Maple Leaf Communications).

Microwave Modules MMT220/28S transverter, 10W output. Not readily available new, but watch for used ones on the market. You may also come across some MM clones produced by Hans Peters VE3CRU ("Transverters Unlimited") - they are good quality, and produce higher output (~15W).

Down East Microwave DEM222 no-tune transverter, 20W output, 1-100 mw input:

DEM222-28CK complete kit (PC board, board-mounted parts, enclosure, connectors, heat sink, hardware, $295)
DEM222-28K board-level kit (PC board, board-mounted parts, $225)
DEM222B assembled and tested unit ($395)

SSB Electronic TV 28-220/01 transverter ($380), 100 mW output. These units have no T/R switching, so that would have to be added externally for single-channel half-duplex operation. On the other hand, there are separate local oscillators provided for the receive and transmit converters, so this looks like a good choice for in-band full-duplex or half-duplex split operation.

Hamtronics XV4 transmit converter (kit, $79), 0.5 - 1W output. The cheapest alternative, and the power level is adequate if you aren't too far from the repeater and have a reasonable transmitting antenna. But you do need to find someone with a spectrum analyzer to get it tuned up properly, and some people have had problems taming this unit.

Down-converters:

Microwave Modules MMc220 (price/availability unknown), 2.8 dB NF.
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Advanced Receiver Research (model no., other details unknown). This unit is in the $100 range and of high quality, but it really needs a front-end preamp. We use one of these converters on the Ottawa 56kb repeater, along with an ARR preamp. ARR may be no longer producing the converters.

Antennas:

You might get by with omni antennas, but multipath can cause poor performance even when signal levels are high. Small yagis provide more margin and help discriminate against multipath. A typical example is the Cushcraft A220-7 7-element yagi (about $50).

430 MHz
~~~~~~~
Transverters and up-converters:

Down East Microwave DEM432 no-tune transverter, 50-100mW output. This is a 3-board set, available in several forms, and there is an optional power amplifier that provides 15W output. The local oscillator board normally has a single oscillator for standard half-duplex operation, but a second oscillator can be added on the board for half-duplex split or full-duplex operation. Some options and prices:

DEM432B assembled and tested unit, including case, $275
DEM432BD as above, but set up for dual frequencies, $300
DEM432K basic kit (no case or connectors), $155
Second LO kit, $8
432PA 15W PA, assembled and tested, $180
432PACK 15W PA complete kit, $135
432PAK 15W PA basic kit (no case, connectors or heat sink), $75
Enclosure to house both DEM432K and 432PA, $25
DEM432-15S complete 15W dual-frequency transverter, $395

Microwave Modules MMT432/28S transverter, 10W output. Not readily available new, but quite a few used ones on the market.

SSB Electronic TV 28-432 transverter ($310), 100mW output. These units have no T/R switching, so that would have to be added externally for single-channel half-duplex operation. On the other hand, there are separate local oscillators provided for the receive and transmit converters, so this looks like a good choice for in-band full-duplex or half-duplex split operation.

Hamtronics XV4 transmit converter (kit, $79), 0.5 - 1W output. The 432 Mhz version of the unit described above.

Down-converters:

Hamtronics ($49/$69/$99 for basic kit/kit with box/wired & tested). Quality of this unit is uncertain.

Microwave Modules MMc435.2 ($115). Current availability unknown.

SSB Electronic K7001-10 ($180). High quality, with a price to match.
~~~~~~~

There are other sources for units in the $100-$150 range, such as Lunar.

1.2 GHz
~~~~~~~
Equipment for operation of the GRAPES modem at 1.2 GHz and the other bands above 450 MHz is a problem, due to the scarcity of converters which have input/output at 28 MHz, not to mention reasonable power output.

Transverters and up-converters:

SHF-1240(K) "No-tune" transverter board ($149 kit, $189 assembled, from Down East Microwave): 144 MHz IF (10 mW drive required), 10 mW output. Also required is the separate SHF-LO local oscillator board ($50 kit, less crystal; $85 assembled). A complete transverter (transverter board, LO board, IF PIN diode switch, packaged in a metal box) is available for $265. Note that no RF switching is included, so if you wanted to run half-duplex, a suitable RF T/R switch or a circulator would be needed. NF of the down-converter is in the 4-5 dB range. Due to the 144 MHz IF, a separate 28 MHz to 144 MHz conversion stage would be needed.

SSB Electronic USM-3 transmit converter ($210). 1W out (20 mW in). Requires external LO source (10 mW). Although normally used with 144 MHz IF, it reportedly can be tuned for 28-30 MHz IF input. Housed in a metal box with BNC connectors.

Down-converters:

SSB Electronic UEK-3 receive converter ($200). 2.2 dB NF, 20 dB conversion gain. The nominal LO frequency is 1152 MHz, for conversion of the 1296-1298 range to 144-146 MHz. An LO output port is provided for driving the USM-3 transmit converter. Housed in a metal box with BNC connectors.

Power amplifiers:

Pauldon (kit, $165): 18W out for 1W in.

Down East Microwave 2318PAM ($205): 18W out for 1W in. Also available in kit form.

SSB Electronic PA 2310 ($250): 10W out for 0.5W in (a 20W out version is $300).

Antennas:

Although loop yagis are commonly used at 1.2 GHz ($89 kit, $109 assembled for the 45-element loop yagi from Down East Microwave), a better choice for linking would probably be the Tonna 23-element yagi (about $70).

Other Considerations (applies to all bands):

The receive converters have very broad front ends, and some additional bandpass filtering will often be needed. A single cavity (or helical resonator frontend filter, in the case of separate receive converters) should do the trick in most cases. There is also a design available for a homebrew 28-30 MHz bandpass filter for the modem front end. This might
~~~~~~~

eliminate the need for a front-end filter, but it depends on your
receiving environment.

56 kbps Summary
~~~~~~~~~~~~~~~
The cost of a 56 kbps station is a bit hard to pin down, given all the
variables. As an example, we'll consider a station for the Ottawa 56kb
LAN. The modem kit and a PI2 card will set you back about $375. The
rest depends on the choice of rf stuff. The total will vary from about
$500 to $800. The "low road" is using the Hamtronics kits and scrounging
up things such as boxes for them and the modem, homebrewing the antennas,
etc. The "high road" is buying higher-quality assembled and tested gear,
such as the Sinclabs transverter and the MM receive converter. If you can
find some good used gear, the total should be closer to $650. Getting on
56 kbps is certainly a more challenging project than plug 'n play 9600,
but the rewards are greater too.

The Packet Frontier: Equipment for Speeds Greater than 56 kbps
~~~~~~

The following is a very rough first cut at summarizing the current situation
for packet at speeds greater than 56 kbps. Commercial availability of
radio and modem equipment for these speeds is nil, so this is really the
domain of the true experimenter!

Data Interface
~~~~~~~~~~~~~~
There is, at least, some hardware that can sink/source data at these rates:

Ottawa PI2 card: up to 500 kbps, maybe more

Gracilis PackeTwin: up to 1 Mbps claimed

Gracilis PackeTen: up to 4 Mbps (aggregate)

RF Hardware for >56 kbps
~~~~~~~~~~~~~~~~~~~~~~~~

GRAPES Modem
~~~~~~~~~~~~
The GRAPES Modem can run at higher speeds than 56 kbps. In his 1987 CNC
article, Dale WA4DSY mentions rates up to 120 kbps. I've run a pair of modems
back-to-back at 125 kbps. Most of the changes are straightforward (e.g.,
changing the baud rate generator crystal from 3.579 MHz to 8 MHz), but there
are two problem areas. Standard 555 timer chips won't work reliably above
100 kHz, so the receiver clock recovery PLL circuit needs more than just
a resistor or capacitor change. Replacement of the 555 with a TI TLC555
does the trick. The other problem is the 455 kHz IF filter: it can be
retuned so that the modem works at 125 kbps, but the eye pattern isn't very
satisfactory. A new filter design will be needed for decent on-the-air results.

N6GN 250-500 kbps RF Modem
~~~~~~~~~~~~~~~~~~~~~~~~~~

Glenn Elmore N6GN (glenne@sr.hp.com) has designed an RF modem for the 902 MHz band which is intended for use at rates in the 250 to 500 kbps range. The modem is crystal-controlled, has about 12W output, and extremely fast turnaround time. Note that this is an FSK modem, and is not at all similar to the spread spectrum "wireless ethernet" systems which are available for this band. Glenn is currently running some of these units at 230.4 kbps, using Ottawa PI2 cards. No PC boards or construction plans are available at the moment. Units for 1.2 GHz have been mentioned, but I'm not sure if they exist. More info on this work and the 10 GHz equipment described in the next section can be found on col.hp.com, in the ~/hamradio/packet/n6gn directory.

High-speed Packet at 10 GHz
~~~~~~~~~~~~~~~~~~~~~~~~~~~
Glenn Elmore and friends (Kevin Rowett N6RCE, Bdale Garbee N3EUA, etc) have also designed an X-band (10 GHz) full-duplex packet data link using inexpensive gunnplexor modules that runs at a nominal 2 Mbps rate. Details can be found in recent editions of the ARRL Handbook. I haven't heard of any such systems actually being put into service yet, but there is a source for the PC boards:

Date: Tue, 10 Aug 93 16:30:44 CDT
From: bob@lachman.com (Bob Van Valzah)
To: glenne@srlr12.sr.hp.com, bdale@col.hp.com, ron@chaos.eng.wayne.edu, tcp-group@ucsd.edu
Subject: 2 MBPS 10 GHz Link Boards Available
Status: RO

Receiver boards are now (at last!) available for the n6gn desinged, 2 MBPS, 10 GHz microwave link as described in the ARRL Handbook and other places. You'll still need to make the 1st IF board yourself, but trust me, that's easy. I didn't believe Glenn at first, just follow the procedure in the article and it works!

The receiver board is 4-3/4 x 5-3/4", double sided, and drilled, *but not plated through* (hence you'll have to solder top and bottom leads in some cases). This shouldn't be a big problem because there are no signal traces on the component side--it's all ground plane.

Folks who helped make these boards available (though they may not all want to admit it :-) are Glenn Elmore n6gn (of course), John Conner wd0fhg, Ron Atkinson n8fow, Fred Reimers kf9gx, Bdale Garbee n3eua, and Jon Bloom ke3z.

They're available from:

Fred A. Reimers kf9gx
FAR Circuits
18N640 Field Ct.
Dundee, IL 60118-9269

for $15. Fred just shipped 8 to me for $5 postage, but I'm not sure what the rate would be for smaller quantities.
~~~~~~~~~~~~~~~~~~~~~~~~~~~

T1 Modem
~~~~~~~~
Clint Turner KA7OEI (ka7oei@uugate.wa7slg.ampr.org) has designed a T1 rate (1.536 Mbps) modem, intended for use in the packet backbone network in Utah. I expect we'll be hearing more about this once it's proved out in actual RF links.

The Widrow LMS and Wiener-Hopf are adaptive digital filtering techniques.

The following books have chapters on adaptive digital filters:

1. Digital Signal Processing - A practical Approach
Emmanuel C. Ifeachor and Barrie W. Jervis

2. The TI Digital Signal Processing Applications Series:
Applications with the TMS320 family, algorithms and implementation
Vol 1 part number is SPRA012A
Vol 2 part number is SPRA016
Vol 3 part number is SPRA017

This series of books deal exclusivly with the TI DSP processors. There
is a lot of practical applications as well as some theory.

The TI literature number is 1-800-477-8924, all they need is the part
numbers and your address, the books are free.

I believe that Hawaii and Alaska are in different ITU Zones and that someof the phone allocations maybe be different. I know that hams in Alaska can use phone in the lower portion of 40 meters, but I am not sure if this applies to Hawaii. Maybe someone else can comment on that.

As to the PACTOR subbands..you will usually find PACTOR stations operating in the .070 - .080 range of each band where those frequencies are authorized, e.g. 14.070-14.080, 7.070-7.80. An exception to this rule might be the WARC bands where 10.140 seems to be a popular frequency. Hope this helps.

2709. Re: Jnos Config with E/Net card

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-14 01:09:28 UTC
From: rdonnell@eskimo.com
Message-ID: <CuI37s.HxH@eskimo.com>
Source record: 47901

Alastair "J." Downs (ee17@csu.napier.ac.uk) wrote:
: Has anyone managed to configure Jnos v1.10xx to work with an ethernet card.
: The cards I have in mind are NE2000, WD8003 etc.
: Sample config file would be very much appreciated.
: I have tried using the clarkson packet drivers and using the Attach packet
: command without any success.

Well, that is what I did - I'm using an NE-2000 and the clarkson packet drivers, along with the 'attach packet ...' command. Here is a transliteration (typing from one monitor to the other keyboard) of the batch file, which will be followed by the autoexec.nos fragment that gets it going.

```
------------------------------------------------------------------------
ne2000 0x60 0xf 0x320 # for sw interupt 60, IRQ 15, address 320
nos
------------------------------------------------------------------------
attach packet 0x60 ether 10 1500 # for sw interupt 60, 10 buffers, 1500 bytes
ifconfig ether ipaddress <my ip address>
ifconfig ether netmask 0xffffffff # not running ethernet as its own subnet
ifconfig ether broadcast <my broadcast address>
arp publish <ethernet machine #1's ip address> ax25 <ax25 mycall> <ax25 iface>
arp publish <ethernet machine #2's ip address> ax25 <ax25 mycall> <ax25 iface>
arp publish <ethernet machine #3's ip address> ax25 <ax25 mycall> <ax25 iface>
route addprivate <ethernet machine #1's ip address> ether
route addprivate <ethernet machine #2's ip address> ether
route addprivate <ethernet machine #3's ip address> ether
------------------------------------------------------------------------
```

The main reason for the broadcast address is to allow using rip routing on the network. The 'arp publish' causes the router to respond as if it were the computer you were really trying to reach, so other stations will send a packet with the ethernetted computer's IP address to the router. Hope that helps.

Also - does the version of JNOS you are using have the packet driver compiled in? Look at 'info' to see if it says 'FTP Software's PACKET driver interface. If not, you can't use ethernet cards with that version.

: Unfortunately, the DCD lite on the PK-88 stays on when the radio is squelched.
: Because of this, the PK-88 will never tell the radio to transmit. It
: receives fine. If I am tuned to a repeater and there is no sound coming
: through the repeater, then the DCD lite is off. I'm kind of confused. This
: PK-88 has been hooked up to my Icon IC-28H for years with no problems.

: Has anyone else seen this problem, and solved it?

Sounds like you have one of the Kenwoods that has unsquelched audio on the
mike connector. Without adding a 'true DCD' circuit (surgery required) to
the PK-88, you will have to disconnect the receive audio wire in the Kenwood
mike plug (green wire if you're using AEA's cable) and use the speaker jack
on the back of the radio for receive audio - or back to the IC-28 :)

: Thanks

Andrew J Lynch (ei938@cleveland.Freenet.Edu) wrote:

: Packet Radio Folks,

: I have a question regarding Windows 3.1 or WFW and ham/packet radio: Is
there a Windows or WFW driver available for the Baycom packt radio modem
that would allow TCP/IP networking functions over packet radio?
: I understand that Windows 3.1 or WFW can use TCP/IP networking with the
WINSOCK.DLL. This provides TCP/IP networking services to an Windows TCP/IP
application. Whatever networking medium used requires a driver, ie
SLIP/PPP, ethernet, token ring, etc.
: Ham/packet radio also uses TCP/IP as a protocol in local area networks. I
have a Baycom modem and plan to use the AX.25 driver withthe DOS program
KA9Q NOS to access the local TCP/IP packet network.

: My question is: Is there a way to tie the Baycom modem into Windows 3.1 or
WFW? You could then use the TCP/IP applications over pacet radio just like
you would over an ethernet or SLIP/PPP, only much slower. I think you would
need a packet driver like the etherne cards require.

: Has anyone got any information on this? If I get any responses, I will
combine and post to this list.

: THANKS IN ADVANCE!!

: Andrew Lynch, N8VEM
: alynch@wpgate1.wpafb.af.mil

: 73!!

You're probably not going to have a lot of luck doing this with Windows and
the Baycom. The Baycom product requires a lot of the computer's attention,
because it has to 'bit-bang' data into and out of the serial port. It can't
take advantage of the parallel-to-serial/serial-to-parallel conversion
capabilities of the serial port, and therefor is very processor-intensive.
This along with Windows being intensive and trying to multi-task is not a
good combination. There are folks who are working on writing a packet
driver to go between Windows TCP/IP applications (Winsock or FTP's PACKET
driver interface) and a KISS-capable TNC. But I don't think you're going to
see it for Baycom-type modems.

Think of it this way - Most Windows systems have trouble keeping up with
19200 baud with only one task open when you don't use a buffered UART. All
the application has to do is get the interupt, read the port, clear the
port, then display (or process) the byte received. At 19200 baud this
happens at 1920 times per second or slower, and you have until the next
charachter has arrived to read the currently stored character before you

will lose data. Also, typically the most intensive processing that has to be done on a character-by-character basis is CRC calculations. When sending characters, all the program has to do is respond to keyboard interupts (if typing), send bytes to the com port, and wait for an interupt from the com port that says it's ready for another byte, and perhaps update CRC calculation.

With Baycom, assuming the software is set up to use one of the PC's timers (the lowest processor overhead), at 1200 bauds, when the interupt comes in, you have to go read the timer, reset the timer, decide how many bit times have passed since the last interupt, stuff and shuffle the proper number of bits into the shift register, account for 'bit stuffing', then see if you've filled a byte. If so, the byte goes into the packet buffer, and if you have time, maybe you update the CRC calculation for the packet. This can happen in one bit-time (1/1200th of a second, more or less, depending on signal 'twist' and modem timing errors). And all that processing has to be finished before the next interupt. Then when a packet is complete and error-free, the driver still has to check addressing, etc. all of this is >before< the packet gets passed up to the TCP/IP software stack. And the driver has to continue handling interupts and dealing with the incoming data stream, trying to make sense of it accurately, until the data stream stops - usually when the squelch on the radio closes. And during all this, Windows is supposed to find time for other applications to run. Not a problem that will be easily solved.

73,

Bob

Hello again everyone,

I was wondering if you knew anything about the Widrow-Hoff LMS algorithm that was used in Sept. 1992 QST's article "Low-Cost Digital Signal Processing for the Radio Amateur". Appearantly the LMS algorithm is nice to use to cut out signals that are repetetive when listening to SSB (you wouldn't use it for CW- cause all you would hear instead of the morse code was a "click" evertime a new tone came buy :)

Appearantly this algorithm is used in the HumVee's to stop engine noise in the cabin. (I think there are other car companies working with it to reduce second-order boom in 4 cylinder cars).

If you know where I can find this algorithm or further information about it, please let me know.

TNX et 73!
Allen Hall n9rzc@uiuc.edu

ps- as always, I look forward to any and all comments that you may have concerning this posting.

Details of the LMS algorithm can be found in virtually any introductory book or paper on adaptive signal processing, e.g., _Adaptive Signal Processing_ by Widrow and Stearns or _Adaptive Filter Theory_ (or something like that) by Simon Haykin. The basic algorithm is as follows:

X(k) is an N-element array of input samples at time k. For a transversal filter, the elements of X are samples in a shift register.
W(k) is an N-element weight vector (i.e., the filter coefficients) at time k. Ideally, when the adaptive filter converges, W() will change slowly or not at all with time.
d(k) is the desired signal at time k. How this desired signal is generated depends on the application. It can be merely correlated with the actual signal.

We define the instantaneous error as e(k) = d(k) - X(k)^T W(k), where ^T denotes matrix transpose.

LMS is a form of the steepest descent algorithm dating back to Cauchy (or some other famous dead guy), where the gradient of the mean

squared error (MSE) with respect to the weight vector is used adjust the weights so as to minimize the MSE.

The trick behind the LMS algorithm is to replace the MSE with the instantaneous squared error in the computation of the gradient. Skipping the math (which is actually fairly simple), we get

W(k+1) = W(k) + mu e(k) X(k)

Simple as that. mu is called the adaptation step size. If it is much too large, the filter becomes unstable and never converges. If it is a bit too large, the MSE will not reach its minimum value. If it is too small, the filter will take forever and a day to converge. A rough first guess for setting mu for a transversal filter is

mu = 1 / (N * signal power).

Ideally, it should be relatively large at first and then made smaller when the filter nears convergence.

As you can see, it's a simple algorithm to implement, which is why it's so popular. It can be slow to converge, however, depending on the error surface and the initial weight vector. Also, because it never (or almost never) actually reaches the minimum MSE, the LMS name is not quite acurate; some people prefer "stochastic gradient" algorithm. But since it's so simple, it's easy to simulate and play around with on a computer. Have fun.

All TNC's fit your bill pretty well. They all run off a serial port, and
contain a microcomputer to handle most of the overhead. MFJ, Kantronics,
Tiny TNC - all will do what you want.

2716. simptr21.zip - Generic TNC comm program (packet, rtty, etc)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-14 14:17:57 UTC
From: jwl@sedist.cray.com
Message-ID: <9408141417.kp13594@SimTel.Coast.NET>
Source record: 47909
Cross-posted to: comp.archives.msdos.announce,rec.radio.info,rec.radio.amateur.digital.misc

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/hamradio/
simptr21.zip Generic TNC comm program (packet, rtty, etc)

SimpTerm v2.1 is a simple terminal program designed to be used with almost any tnc or tu on the market. Features of SimpTerm are:

o Split window operation.

o Macro key definitions.

o User customizable Help screen

o Most of the non-ascii keys can be used as function keys

o Optional scroll back feature on the receive window and trans-mit windows

o Simple status display in the middle of the screen

o Capturing of data to a disk file

o Access DOS commands without dropping communications connection

o Control of the com port definitions from command line, init file and keyboard.

o Works on 8088 as well as 80486 and everything in-between.

o Status line

o Small enough to work well on resource tight platforms, like laptops.

o Selcal functions, limited unattended operation.

o Times can be in GMT or local time.

o A station logging function.

o User selectable color scheme

o Automatic "cq" operation (or any other repetitive transmission

o Function keys and control keys can be assigned to a macro string, cause a file to be uploaded or call a function within the program.

There are loads of programs that are tailored to specific tnc's and there are dozens of good terminal programs that can control any tnc in a "dumb" (that's a technical term) manner. This program is an attempt to provide the average ham with something in-between. It has a lot of features, but not so many as to make use of the program or the tnc hard. It requires you to know the commands of your tnc, but also gives you the flexibility that only direct communications with a tnc can provide.

Date: 1994-08-14 19:09:00 UTC
From: steve.diggs@totrbbs.atl.ga.us
Message-ID: <1709.18.uupcb@totrbbs.atl.ga.us>
Source record: 47922

-> I'm looking for a mods database for various radios to allow them to
-> send/receive 9600 baud packet. Are there any electronic archives
-> that my have these mods available? How about some proceedings of
-> some of the various conferences?

Hi Terry,

I'm actively involved in modifying 70cm rigs for 9600 packet; I think we can help one another. The TS711, one of the rigs you mentioned, is 1st cousin to my TS811 and it sure can be modified for 9600. Try ftp to oak.oakland.edu and look for the file 711 under the pub/hamradio/mods/kenwood dir.

If you can't find it, you can download 9600mod.zip from my phone BBS at (404) 921-8687. I am collecting mod files of all types, especially 9600 mods.

We are starting up our first 9600 digi right now in Atlanta, and are having a lot of fun <?> with it.

More on the mods: I understand there are MOD file servers across the US, and Sou. CA is a hotbed for 9600 packet.

Let me know more about your situation.

Just to correct some slight misinformation: I purchased a new copy
of PC for $400 including shipping. Price increase was active from
8-1-93. There are no more upgrades being planned for the currect
(oops.. current) version of 5.4-48 as all effort is going into the
new Version 6 which will cost a bunch more $$ to upgrade your
$400 copy of PC. IMHO this prices PC way out of non-club budgets.
And for me at least, the tech support on the software is non-existant.
In fact they still do not have me down as a registered sysop and I
purchased the software back in April!!
The best way to obtain PC is to take over a non-functioning cluster
copy. I know of two personally who have copies lying around who might
sell off for half of what a new copy costs (after the fact for me
unfortunately) and Harvard Radio will change the call sign for a
fee (who knows what that might be!).
Good luck!!! 73 Al Schlaugat allanws@cup.portal.com N9ISN

>all you would hear instead of the morse code was a "click" evertime
>a new tone came buy :)

it also works the other way around: you can use it to pick out the
repetitive (correlated) signals, and remove the random (uncorrelated) ones.

the algorithm is frighteningly simple, and most textbooks on signal
processing will contain a discussion of it. further information should
be found in such a place, and not the network. try a library.

but for those impatient folk with Linux machines and sound card, what follows
is a very small and very simple piece of demo code that runs an LMS on
/dev/dsp output. it is disgustingly inefficient (too many ops/sample,
use of double's etc), so only runs at about 1/4 real-time rate (8000
samples/second) if you have a 33MHz 486 and have cached the sample file.

usage is simple: grab a sample from /dev/dsp into some file: "cat
/dev/dsp >blee". then "./lms <blee >/dev/dsp", or write the output to
another file and blat that into /dev/dsp to listen to it without the
gaps. "lms -c" removes correlated signals [which is what heterodyne
supression filtering does] and "lms -n" removes uncorrelated signals.

as simple as this is, it does a *remarkably* effective job.
---- begin lms.c ----
```
#include <stdio.h>

2722. Help! I need info for a telemetry project(packet driver??)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-15 05:07:00 UTC
From: LOUXWE96%CS25@cadetmail.usafa.af.mil
Message-ID: <LOUXWE96%CS25.148@cadetmail.usafa.af.mil>
Source record: 47913

Hello,
I am a cadet at the US Air Force Academy and this semester I am taking an independent research project where we will be building a hybrid rocket and testing it.

I am in charge of the telemetry on this rocket. We must send and receive various info(i.e. temp, pressure, g's, etc.) and put this info in some readable digital form. Being as this is only a college project we do not have very much money and need to find a cheap alternative to expensive telemetry equipment.

I have been reading hobby radio magazines and think that your technology would be just right for my purpose. I need you to tell me if there is anything in the radio community that I could use for this. I think that it may be possible to send the info from an onboard transmitter and then use a reciver and packet driver to send this information into a PC and in a digital form, but I do not know enough about this technlogy to know if this is something that will work. I need info from you.

Please, any information on what to do or where to look for what to do would assure my undying support!

Thank you!
Bill

I am currently running JVFAX 5.1 (anyone know a FTP site for a more recent version?) with the simple comparator interface. Before I launch head on into building the full AM/FM serial port version, are there any plans to use the Sound Blaster ADC?, or are there any alternative circuits, since the ADC chip is proving difficult to source. Cheers.

Mike.

: >Also I was wondering if directional dish antennas at the GHz frequencies
: >wouldn't be best to provide for reuse of bandwidth and use of less power.

: Sure is, if you can get line of sight paths. There's plenty of bandwidth
: available for really high speed transmission too. The problem is getting
: the paths. Most packet networks are sparse, requiring long links, and there
: aren't always suitable high sites available for relay.

LOS paths aren't necessarily a requirement, particularly if you don't need
a lot of bandwidth.

In some cases, a 10 kHz bandwidth microwave link might do a lot
better than 222 link subject to heavy interference.

An interesting path I've worked twice on all bands from 1.3 to
10 GHz is Mt Equinox to Woburn, MA. While Equinox is at 3800 ft,
there is Grand Manadnock at 3165 ft. almost in the center of
the path (54% of the way there). On 2 meters, I need 10 watts
and a 10 dBi antenna--with 2 watts to a 7 dBi antenna I need
someone to relay! But, this knife edge path is workable all the
way through 10 GHz running QRP. Path length is 179 km.

The big problem with microwaves is trees--you have to get your antennas
clear of the foliage.

Secondary problems are generating power, frequency accuracy, and
pointing the antenna.

Getting a watt or more at microwaves is getting easier and easier
as companies shift towards consumer markets as opposed to military
applications.

I expect the GPS system to help with frequency accuracy--the only
real problem is cost--little out of my budget right now but the
stuff gets cheaper all the time.

People do manage to get their satellite antennas pointed, eventually.

: while looking for other stuff), and seem to recall reading that dsss is
: the easiest mode to sync to. I think you sort of slide your sequence back
: and forth over the signal, and when they're synced, the signal gets clear
: in an easily detectable way. (Can't remember the details of that, tho).

The same principle is used in the GPS constellation and some kinds of amateur packet modems to enhance the transmission reliability of small amounts of data in the presence of a large amount of random noise.

The base transmits a short pseudorandom sequence of bits. The receiver slides the same sequence along the uncorrelated background noise until the receiver notices that in one particular position their are far more matching "peaks" and "valleys" than in any other position. You are now in sync and can then copy the bursts that follow relatively easily.

Reputedly phones like the Tropez do not actually use spread-spectrum for the voice portion of the transmission, though, so we're still going to have to wait for Voice-PGP or something before we have true voice/data radio security.

Source record: 47924

There seems to be a load of rubbish in this thread! While DXing to a distant BBS is usually not a good idea, on the basis that it should have the same bulls as your local one, the network should be able to handle a bit of interactive traffic between users who are several nodes apart. I have in the past had useful chats with amateurs several hundred miles away using the node system - when replies arrive in under a couple of minutes it is no problem at all.

Having said that, I can sympathise with those who maintain large chunks of the network with no support - my local network is effectively run by three people, with occasional help from a few others. There are probably 600+ users in the coverage area.

> 73's Adrie.
>
Yes, look for SoftKiss 1.8. This driver makes a Baycom-style modem look like a
KISS TNC. Then you need NET/Mac and IM/Mac for NOS style use, or you can buy
the commercial program "Savant" for AX.25 use.

Look for the freeware stuff at ftp.ucsd.edu and the sumex site. Savant is by
the same author as the shareware program Virtuoso.

Correct. It has some interesting RF properties which you touched on.
Taking a wider view (no pun intended), spread spectrum is just another
method of implementing the physical layer. If you want security,
encrypt the digital data prior to sending it to to the DSSS
"pseudo noise" "mixer".

2733. RE >Packet with Mac LC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-16 02:52:40 UTC
From: jerry@kk6wb.kg6kf.ampr.ORG
Message-ID: <314@kk6wb>
Source record: 47926

>Subject: Packet Radio with apple LC ?
>To: ham-digital@ucsd.edu

>Hello there,
>does anyone know how to use a mac (lc) for packet radio, i.e. with the baycom
>or another
>modem? Are programms available on anon. FTP sites ?
> 73's Adrie.

Dear Adrie,

Your modem or printer ports on your Mac LC are RS-422 with is compatible with the RS-232 interfaces on most TNCs. The trick is to find the proper adapter cable to convert 8-pin DIN to 25-pin RS-232. Most Radio Shacks or Apple dealers sell them. Find the simplest, cheapest terminal program (some are available from ftp sites free) and see if you can communicate with the TNC with the terminal program. If you can do this you are ready to get on packet.

Follow the TNC manufacturer's insructions for connecting it to your VHF/UHF radio. This may require a little cable soldering to make the proper connection to the PTT and earphone jack on your rig. Most TNC makers are good with detailed instructions.

I use a Quadra 660 AV connected to a MFJ-1270B and can do standard BBS packet with a terminal program. I also am experimenting with TCP/IP using NET/Mac 2.3 software (this requires a TNC with KISS capablilty. Good luck.

I am still an HF newbie and with the current state of the bands, it's not
easy for us newbies. Last night while scanning around what should be the
CW portion of the 40 meter band I heard a QSO between an Hawaiian station
and some foreign station. Als the Hawaiian station claimed he was going to
QSY back to a quiet spot he had found between two AMTOR subbands.

My question are two:

1) How can a Hawaiian, which despite Dan Quayle not understanding is part of
the US, transmit phone in a non-phone portion of the band.

Joe --

Stations located in Hawaii and Alaska are authorized phone on 7075-7100 kHz
(I forget which part 97 section has it listed). There's an inter-island net
which used to meet Sunday mornings on 7080 (or so) LSB.

Fine, but could you guarantee a 60 db fade margin 7x24 52 weeks a year,
and no heavy multipath? That's what you need for a reliable data link
at a resonable speed (1 Mb+).

Packet Radio Gurus:
Would an Elmer help me out of this NOS jam?

I need a copy of an AUTOEXEC.NOS file for a PA0GRI NOS configuration on my PC. I am using a BAYCOM modem (finally got that working... more details after I work out the bugs) and the AX.25 drivers for BAYCOM. I had a working copy, but during configuration/testing, it got corrupted and now it is scrambled. My backup NOS.ZIP got scrambled too, so next time I am keeping the backup on the shelf rather than on the computer.

I was trying to set the entire system up on a 1.44MB floppy disk, but it somehow did not set up correctly. I think the floppy may be on the fritz...

Can/would anyone help out and send me a copy of their AUTOEXEC.NOS for NOS with BAYCOM modem? Thank you in advance.

73!

2741. 900MHz phone spread spectrum systems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-16 17:53:42 UTC
From: wolf@beta.lanl.gov
Message-ID: <32quf6$7im@newshost.lanl.gov>
Source record: 47930
Cross-posted to: rec.radio.scanner,sci.electronics,sci,crypt,rec.radio.amateur.digital.misc

here's the summary of relevant details that arose from my earlier post
requesting details on the 900 MHz ss phones. i was somewhat dismayed;
very few seemed to have any hard facts on these systems. i tried to
sort out the conflicting info, so some of this may not yet be right.
hopefully someone in the know will enlighten us.

i had asked:

" does anyone have any details on the ss systems used in, say, the escort
phones? spreading sequence generator, moduation methods, synchronization
schemes, etc.? one of the felows that i talked with at cincinnatti microwave
suggested that their phones choose a spreading sequence randomly whenever the
phone gets used. is this true? "

it turns out that there are at least two digital schemes for 900 MHz phones.
the second, not ss, is what the tropez phone uses. first i'll point out what
appear to be open questions, then i'll summarize the tropez and then move on
to the ss phones. finally, i'll note the cryptographic security and attack
issues that were mentioned and end with some micellaneous items.

Open Questions:

what is the spreading sequence mechanism? details?
how is the sprerading sequence and digitized audio used?
audio sampling rate?
spreading sequence rate?

for the tropez, there are similar questions, though the modulation is not ss.

chip-set details?

Tropez

one poster suggested:

>>p.s. There are reports that the audio is transmitted in the clear on 450
>>MHz. Not sure of the signal level, tho.
>>
>
>yes... I reported this late last week... and am still researching it. My
>phone though, is the Tropez 900 DL which is not spread-spectrum but
>digitally modulated on single carriers within the 900 MHz band. What I
>have found is that there is some leakage of in-the-clear audio in the

>430 MHz amateur band from the handset. Others have found and reported
>similar signals. I am trying to get someone from VTech (the manufacturer
>of the phone) to discuss this with me... but they seem to be having trouble
>returning my calls.

thus it appears that the tropez does not use ss, and that there is a low level
430MHz or thereabouts (what is the exact frequency?) analog leak from the phone.

the same poster gave some details on the tropez phone's digital system:

>I believe the modulation is PCM... and it is scrambled with a one of
>64K possible patterns that is chosen each time the handset is removed
>from the base...

what is the pattern generation mechanism? how is it in some sense "randomized".
one guess would be that there is a continuously generated pseudorandom sequence
and that the time that you start to use the phone determines the phase of the
sequence relative to the start time... this would be a silly sort of rng tho.
but it would _suffice_ since it is not too difficult to design a pseudorandom
sequence generator with a short correlation length.

one would also like to know if the pseudorandom sequence bit time is long, or
short wrt the analog digitization time.

also, what is the method for using the pseudorandom noise with the digitized
audio? i.e., are the two x-or'd or something more "interesting"?

finally, if there are indeed 64K possible patterns, what generates and
determines these patterns?

another poster commented on the modulation scheme, gave a bit rate, but did
not comment on the number of pseudorandom patterns or their method of
generation:

>I'm fairly satisified with the 900 MHz Tropez I've got right now.
>It goes almost a block radius around my house. The Tropez is *not*
>spread-spectrum.. Tropez uses a single channel 16 KHz PCM signal
>that is about 100 KC wide. Unless you are in a super saturated
>location, I am not convinced that spread spectrum is significantly
>superior to the channelized units.

later they wrote, but no mention of what use is made of the "key":

>The PCM chip in the Tropez is made by Motorola. ... The CPU looks to be
>something like a 6809 derivation.
>
>The key is a 16 bit word. I don't know if there is an easy way to
>get in sync once the initial hand-shaking is done -- probably there
>is, because the system has to be farily robust in the presence of
>signal interruptions and multipath distortion.
>
>I believe the code is not sent out over the air, but is downloaded
>directly into the handset when you put the phone on the base unit.

then some comments on how the handset and base sync:

>I've noticed the base sends out a little ping when you set the the
>handset on the base. I surmised the ping does two things: 1.
>Sees if anybody else is on the same channel, if so change to
>another channel.

SS 900 MHz Systems

the folklore is that the 900 ss systems in use use direct sequence ss:

>My understanding is that these phones use direct sequence spread spectrum.

as to the synchonization scheme, the typical autocorrelation method was guessed:

>I think you sort of slide your sequence back and forth over the signal, and
>when they're synced, the signal gets clear in an easily detectable way.

and another poster said:

>Once you know the code and have the incoming signal, you can use some
>kind of sliding correlator- try the, say 63, possible starting points
>for the sequence, and find which one produces the larges received
>signal, ie the biggest correlation peak. Then you continue to lock

and a comment on "64K" codes, which i don't understand at all! whatever!
maybe someone has some actual details on the ss systems in use?

>When they say "Uses digital spread-spectrum techniques with
>64,000 different codes," they may probably be saying that there's one
>sequence and 64K access codes to dial out, which is the same as an analog
>cordless with 64K security.

another comment on the spreading sequence (?) states:

>The best US system I have heard of uses 16 bit encryption...

clearly some details are missing!

my guess is that there is a lfsr that is 16 bit wide, generating a 64K
m-sequence that is x'or'd with the digitized analog... the normal trick.

again, what is the bit rate of the prng? how many spreading sequences are
available? etc. so far we've seen no good details...

a comment on the setting of the "security code", no details on what "security
code means":

>According to the AT&T owners manual, The security code changes
>automaticly when the phone goes off hook.

one poster gave some information on the number of legally available spread-
ing sequences:

>Each Spread Spectrum user in the 900MHz range has a choice of 4
>types of spreading. I believe they are the same type as the ones allowed
>for Hams.

note: 2 lfsr schemes x 2 prng schemes = 4 types of modulation schemes. these
are the legally available ham modes.

Crypto and Security

one poster writes:

>Direct sequences are easy to figure out. (These are single shift register
>generators.) If you know how long it is, say N stages, all you need is N+1
>bits to figure out the code and the synch.

another responds:

>Strictly speaking what you say is true (and you need 2N consecutive
>bits) with two (important) conditions:
>
> 1. The shift register must be _linear_, i.e., the feedback
> bit must be an XOR of some fixed subset of the current bits
> of the shift register.
>
> 2. It is good to have access to the pure spreading sequence
> _unmodulated by data_, you see, sometimes one period
> of the spreading sequence spans more than one data bit
> and this causes inversions.
>
>Of course, these two problems are trivial in a crypto sense. If it
>is right that they're using m-sequences (maximal length sequences)
>in these cordless phones, yes m-sequences are linear hence
>satisfy condition 1.

the second poster gets close to the issue of how to attack a ss phone
system. note that if the quiet time digitized audio spans more than
2N bits that you then have an instant "in".

is there a reference to the result mentioned?

we need details on the sppreading sequences, rates, etc. anyone have a phone
and care to look up their part numbers?

another comment on security. it would appear that security is nonexistent if
only a few spreading sequences are allowed, unless there is some sort of
additional crypto layer in the system. note that the fcc does not allow hams
to pre-encrypt their transmissions, as is suggested below.

>> Spread spectrum was not developed as an encryption scheme.
>
>Taking a wider view (no pun intended), spread spectrum is just another
>method of implementing the physical layer. If you want security,
>encrypt the digital data prior to sending it to to the DSSS

>"pseudo noise" "mixer".

Miscellaneous issues

a comment on who is making ss systems (?)

>Maxim is now offering some of the 9 GHz process technology they bought
>from Tektronix. They have a spread spectrum transmitter chip you might
>want to look at. They also have technical information about spread
>spectrum to help you.

another comment on something relevant to making listening devices ? i'm
not sure what this poster intended!

>Look up companies QEI and CYLINK. Cylink is in Calf. Both about $5grand. One
>is audio only while Cylink is digital u to 500kbaud for real time video
>digital stuff. 1200 units can be on same channle AT ONCE?

one poster's thought on jamming and encryotion:

>Wasn't one of the main purposes of spread spectrum to make it
>harder to jam a signal? The encryption is just ancillary, and
>not that good? The encryption only becomes secure when you
>use a one time pad...right?a

and the response (i don't want this to become a thread on how easy it
is to hide a ss system. i'm guessing that it would be very difficult
given the fcc's mandate (if one poster's statement is correct) that
only a few (maybe as few as two) spreading sequences be allowed.)

>Spread spectrum was not developed as an encryption scheme. The
>properties that makes it desirable are :
>
> Protection against jammers. This is measured in the AJ (anti-
> jam) ratio. Some simple math shows how much more jammer
> energy is needed to cause bit errors(digital communications)
>
> Low probability of intercept. SS signals can be placed below the
> noise floor in many cases. This means that covert operation
> can be conducted with some communications.

I know of five TNC2 clone designs available in the UK, or you could ask
TAPR if they still do one themselves. By using one you have the
advantage of being able to run all sorts of different bits of software
depending on your current fancy. Be careful about which modem chip a
particular design uses though, because it appears that the 7910 is being
discontinued.

I don't have a copy of Part 15 here, but I believe you will find
very explicit standards for what 900MHz cordless telephones authorized
under Part 15 are allowed to. I recall that it is quite restrictive.

: Amateur radio WA8NVW NavyMARS NNN0VBH @ NOGBN.NOASI

Karl makes several good points - since your friend is using a commercial
radio, unless he wants to manually reprogram all the data channels he will
need a multi-mode that uses the CCITT tones. Also, FSK is the way to go,
but I don't beleive you have that option on that radio. As I recall, the
M700 does have that capability.

As a former employee of AEA I know that they make a unit that uses the CCITT tone set, and has a following of commercial shipboard operators and shipping lines that prefer it to other >commercial< products in the market place. By the way, the CCITT tones are 1615 and 1785 Hz. Most of the radios will pass the amateur tones, and the Icom is no exception, but if you use one with the standard amateur tones (2125/2295) you will have to correct the radio's frequency programming by 510 Hz every time you switch to a channel where data is in use.

Note that I am not aware of >any< multimodes that are as small as you desire - probably the smallest is around twice those dimensions in all directions. And, unfortunatly, all of the physically small multimodes are reported to comprimise performance for that size. This makes a big difference under weak signals, fading or busy band conditions.

AEA's favorite is the model PK-232MBX - it as about the same size width and depth-wise as the M600, and about 3 inches tall, so it coudl be above or below the marine radio. It is made in a commercial-tone unit, and you or your dealer will need to contact AEA directly for it. As it is not a stock PK-232MBX, AEA does sell it at a higher price than the mass-manufactured amateur-market mode. As mentioned, any number of commecial shipboard operators and marine hams I've talked to swear by that product.

Hope this information is of value. 73

No - most of the construction articles would be for RTTY terminal units, and pretty old now. Other than some of the now outdated packet-only controllers offered in the mid 80's, there have not been any construction articles I know of for an intellegent data interface. The closest you would have been likely to come was Heathkit's HK-232 clone of the AEA's PK-232, offered as a kit. Heath has been out of the kit business for about 3 years now, so unless you find someone who got a kit and never started it, you're pretty much out of luck. Part of the problem is that the companies that make the multi-mode TNCs have invested lots of money in the programming of their products to support the various modes, and are not interested in giving away their efforts. Also, since these are tightly integrated hardware and software products, the software wouldn't really work on anything else.

I have seen programs mentioned for non-intellegent interfaces usign a PC for the processing, as I'm sure you have, and that, combined with an older dumb modem or terminal unit design is going to be your best chance to get something going that you build. Even with the inexpense of used PC systems to dedicate, its usually not cost effective as compared to one of the commercially manufactured products.

Good luck in your search.

Hi,

I am looking for info for a fellow ham.
Does anyone know if the Icom IC-730 can be modified for use on AMTOR?
I have had a look on OAK.OAKLAND.EDU and on a couple of Ham CD-ROMs
but can't find anything. The 720A and 735 get a mention but not the 730.

Any help or pointers in the right direction would be most appreciated.

Can I suggest that the original poster refers to a basic text on Spread Spectrum Comms, rather than relying on often-conflicting net.hearsay. As an introduction, I would recommend Spread Spectrum Systems, R.C. Dixon, second edition, John Wiley & sons, New York, 1984. There are also many papers on the subject from IEEE journals and conference proceedings, some of which are good introductory tutorials.

Sometimes the confusion generated from a question on netnews can be quite unhelpful for a beginner in the subject- armed with the basics from articles and books, you can then start to understand specific systems, such as Qualcomm's CDMA proposals etc, or domestic phones using this system, but it is not helpful to dive in and be faced with the commercial views and popular misconceptions when you need the basic academic grounding, ie in m-sequences, pn codes, LFSRs, DS/FH/Hybrid systems etc.

Its done all the time, but there's no guarantee that the message will get thru unless the gateway station is *well* connected and maintained. And that appropriate routing and paths are available to and from stations (BBS's) beyond the gateway machine. 73/bob ka4byp

Gary Coffman KE4ZV (gary@ke4zv.atl.ga.us) wrote:

: Fine, but could you guarantee a 60 db fade margin 7x24 52 weeks a year,
: and no heavy multipath? That's what you need for a reliable data link
: at a resonable speed (1 Mb+).

The absence of multi-path is a distinct advantage to using microwaves
and a big dish over long or bad paths with lots of reflectors. You
might use a much bigger dish than necessary according to path loss
equations to remove multipath.

My post was merely to indicate that you shouldn't rule out microwaves,
even when 2 meters appears marginal. Some people actually think that
if 2 meters isn't good, you shouldn't bother trying to do it on
microwaves. Actually, they are right if you are talking about
2 meter EME setups, but how many people are using 1500 watt amps and
arrays of yagis to get data through?

I'd like to remind Gary that plenty of people think that HF data links
are worth pursuing, even over paths not much better than I described.
Certainly no where near the quality mentioned, even at 1200 bps :-).

As I see it, why not be open to the possibility of a 56 kb microwave
link being just as good as a 56 kb VHF link? Sure, the hardware
isn't quite here yet, but it isn't too difficult to see from the
trade journals that it can't be all that far away. For amateurs
volunteering to put data links on their property, microwave links
make much more sense than VHF links. A lot of potential volunteers
don't want to see their VHF spectrum degraded with a transmitter on
24 hours a day. There are fewer people interested in microwave DX,
and many of those that do prefer to operate from mountaintops, away
from their homes.

I have an IC730 and had it connected to my PK232. I tried using it on AMTOR and PACTOR, but was not comfortable with it. Its uses T/R relays and it "chatters" on/off for each burst of data. The blower fan also turns on/off each time a packet is sent. Not only do I feel its bad for the transceiver, its bad for the operator just being in the shack listening to it.

So to make a looooong story short, I wouldn't recommend using the 730 on those modes. The desing of the 730 was before AMTOR and PACTOR, the rig is not design to handle them.

Jim Swenson (newmedia@teleport.com) wrote:
: Please help me find the smallest multi mode TNC available. I am provisioning
: a 40' sailboat for a ham friend for a several year cruise. Space is at an
: absolute premium. He'll be operating exclusively HF through a modified ICOM
: M600 SSB marine transceiver. So 300 baud max is fine. Required modes include
: Packet, WeFAX, NAVTEX, RTTY, CW. PACTOR, G-TOR and SITOR would be cool but
: not mandatory. Cost is a secondary consideration. The size of most units
: I've looked at are just not acceptable. Ideally, we need something about the
: size of a new Supra modem (about 1" h by 5"w by 7" deep). Is there such
: a beast. I'd appreciate any help.

I'm not sure if the company's name is Grace or LL Grace; I remember the
ads from the inside front cover of QEX magazine from the ARRL. They make
a DSP-based multimode TNC that is physically about the size of a 1 1/2
long TAPR TNC2 type TNC. I'd GUESS (and it's only that...) 1.5 x 5.5 x 10.
I think they are located in New Jersey. Sorry about not being more
precise on the details, but that's the only unit I'm aware of that would
meet your space requirements.

However, I'd strongly recommend that you make room for the PK-232MBX.
It's an amazing box for the price, and very, very popular. It must be
good or it wouldn't have sold so many thousands of them.

Message-ID: <32ugib$m02@vixen.cso.uiuc.edu>
Source record: 47865

In a previous article, AllanWS@cup.portal.com (Allan BA Schlaugat) says:

>copy. I know of two personally who have copies lying around who might
>sell off for half of what a new copy costs (after the fact for me
>unfortunately) and Harvard Radio will change the call sign for a
>fee (who knows what that might be!).
>

When some hams in Indiana wanted to change the callsign, the fee was $100.
They decided to leave it as it was.

While buying an unused PC copy is a way to get the software, be sure you are
buying a version 5 release! The earlier ones aren't compatible.

Is $400 really excessive? If you own a modern transceiver, you paid much
more than that for it (new). Add an antenna, amp, keyer, computer, etc,
there is quite a bit tied up in this hobby. If there is interest in DX
operation in your area, you should be able to find local support for the
cluster. Here in Central IL, we have fewer than two dozen hams who play the
DX game, but all are willing to support the Cluster. I suggest that you
ask around - you might be surprised to find that there are, indeed, people
willing to pay money for access to timely DX spots!

In a previous article, mfoster.amoco.com (Michael H. Foster) says:

>Has anyone optimized their x1j parms?
>With several band openings over the past few weeks, the x1j's locally
>lose their buffer space and hose up until a reset is given. We are
>trying different parm settings hoping the node will release it's buffer
>space faster, but we have no specific parameter documentation to guide us with these
settings.
>Can anyone provide any insight or specifics?
>

One of the best things to do is lock in the nearest neighbor routes and
set the port QUALITY to 1. That way, all nodes except for the ones that
you have locked in the local ROUTES table will be ignored. Even tho the
band is open, you don't want all of those temporary paths reported.

The change in the PARAMs list is the second or third one; radio port
quality. Once you lock the routes, you can change the 192 to 1.

In this area, there are about 10 digi's that can be heard on 144.91 when the
band opens. The locked routes keeps the network sane.

By the way, if you are running BPQ at your local BBS or DXcluster, it should
also be locked to only the nearest neighbor TheNet nodes.

When I origanaly posted my first message on this news groupe I diddn't anticipate such an onslought of replies, I was not flamed (thank goodness) but I did receive quite a few non the less.

Most of them were supportive of my actions but cutioned me on how big of messages to send throught the net. The rest were unsupportive to say the least.

I feal that I stirred up a small controversy in this news groupe.

I ownly do my packetting in the wee hours in the morning (from 00 - 0500pac), due to the high packet use through out the day in my area, any thing below 25watts has no chance at a decent connection (I run packet on my HT). I ownly do my BBSen on the wa6ham bbs in pittsburg cal. I like to set a goal on how far
I can go on the net in a single night. so far colorado springs is the farthest west I've gotten, I'm trying to get back to St. Joesepg mo. I have family there.

Currently I'm involved in a project requiring constant access to internet anywhere in the United States. I know almost nothing about packet radio, but someone said such access may be possible with packet radio. Is this possible? If so, how much slower and unreliable is it?

I couldn't find an FAQ... so if this is a very common question, sorry!

Likewise unfortunately, which is why I posted the article previously.
Unfortunately, the person who followed up to that article (3 times for
some reason...) didn't seem to appreciate my attempt to be helpful, as
denoted by a slightly smouldering, if not exactly in flame email...
why is sci.electronics carrying so much flamage these days? I am
tempted to quote the section of one of the news.answers FAQs which
suggests visiting the toilet before posting... but that would probably
lead to some of the more proliferous posters spending their day with a
terminal in the "smallest room" :-)

Source record: 47872

>I currently use a Baycom BP-1 on a 8088 PC. Being that I am only doing
>packet, what advantages would I have upgrading to a more expensive TNC

basically, a separate hardware TNC is better at being a TNC than the software TNCs in several respects. it comes down to being able to use the computer for something else and still have the TNC function available...in some cases you get added functionality since the TNC could have a mini-mailbox in it and the TNC could be left on to be a digipeater for other stations and such.

the software TNC is attractive in that changes to things can be easily (??) done since "it's only software." (famous last words...)

several of the guys here built up the "PMP" style packet boxes and in the end we really want a real TNC we can hang on a terminal server so we can run packet from the desk at break time...8)

hopefully we'll make enough bucks this year at the hamfest to swing something like an MFJ-1248 or whatever the model number is...maybe even a radio to go with it...

: Mike, wa5txx

If you are not running X1J Release 2 you should change firmware. I had buffer problems and they went away with the newer version firmware. I have been told that upgrading the TNC to 10 Mhz, installing a DCD mod, disabling the IProuter, and running with closed squelch all helps the CPU/buffer problems.

NEDA publishes a parameter list for X1J that will get you started.

My preference is a KPC-3, I own one and really like it. The feature that I find really useful is the ability to add an internal 9 Volt battery and operate portable packet. It's a very compact unit, but has excellent features. I've upgraded to 128K memory, which allows for quite a large mailbox. I'm running TCP/IP with it now under KISS mode with JNOS and have no problems at all. Hope that helps.

Well of course, but HF offers ranges that are essentially impossible,
barring EME or quirk propagation, to duplicate on the microwave bands.
The primary advantage of microwaves is the bandwidth available for
fast backbone links. The primary advantage of HF is the long single hop
range available, albeit at low data rates, for non-realtime relay. The
primary advantage of VHF/UHF is the ease of equipment availability off
the shelf, IE a *user* environment. Three very different situations for
three very different uses.

>As I see it, why not be open to the possibility of a 56 kb microwave

>and many of those that do prefer to operate from mountaintops, away
>from their homes.

This is, of course, a good point, but cans are less obtrusive than
dishes. And even VHF Dxers are rare. My experience has been that there
are very few home locations that are suitable relay sites at UHF, much
less at microwave where the dishes generally aren't appreciated by the
architectural committee. It's also a shaky way to build a network. People
move too much. It's better to get permanent high sites, even if you have
to pay a bit of rental for them. If amateur density were high enough for
cellular technique, and it is in a very few places, then using multiple
home stations for relays may be viable. But in the common case of a very
sparse network, you need the very best sites you can find to maintain
network connectivity. One of the rare VHF Dxers *might* be in one such
location, but it's much more likely that a commercial site will be at
that location.

Users can usually hide a vertical in a tree, or a plastic vent pipe, but hiding a dish is a bit more difficult. Given the difficulty many amateurs have with outdoor antennas, UHF omni is a better choice than microwave directional for slow and medium speed MANs. Network trunks between high sites *should* be moving well past 56 kb data rates, and they can sometimes use directional dishes over LOS paths. However, even commercial sites don't like the windloading of big dishes on their towers. So I see little use for slow to medium speed data links at microwave, but I do see application for high speed microwave fixed links in select locations where LOS paths allow small dishes, and for medium speed VHF links in other cases for beyond horizon trunks where power can be easily substituted for antenna gain. For some hops, we'll probably always be stuck with slow HF paths.

No doubt there exists an exceptional situation where a 56 kb or slower microwave link would serve best, but then that's why the 56 kb RF modem is designed to work with transverters. In theory, you can put them on any band you like.

I know my ideas of how to do MANs and trunks are at odds with Glenn Elmore's ideas. I think I have a better handle on the practical home user and relay site situation than he does. While his approach has technical merit on its side, mine has, IMHO, a firmer grasp on other practical realities. In an ideal world, we'd have very fast hub and spoke MANs, using directional antennas at microwave, with high throughput for the bulk of data activity in an area. And we'd have very fast, to minimize latency, point to point long distance microwave trunks to serve the less frequent interlan traffic. But this isn't the ideal world, and I don't expect that to change much for the better in the foreseeable future.

I expect the very few long distance trunks, with long relay site separations, will be heavily loaded by users from many MANs, daisy chain fashion, and that most MANs will be forced to use omni methods for user access. That implies that users need to stay on frequency bands where practical omni ranges are available, and that trunks be on bands where point to point operations at the highest speeds feasible, consistent with the hop distances required, are easiest. That may be upper VHF (219 MHz) in many cases, LOS microwave or HF in other cases. I see few situations where beyond LOS microwave at low speed will be useful unless sufficient power for forward scatter sites with modest antennas becomes much cheaper and easier. (And can somehow avoid being a bio-hazard)

Gary

Yes, $400 is excessive. It's excessive because cluster is such a bandwidth
wasting kludge. (Ok, it's a *useful* kludge, but kludge it is.) You can
use free broadcast server software sending the info *2* times, one uplink
and one broadcast (Pacsat protocol), instead of *27* to accomplish the
same DX spot reporting. That's much more bandwidth friendly. Fills can be
requested by user stations if a packet is missed, but that should take up
lots less bandwidth than repeating the same data over and over and over to
each and every connected station as cluster does.

I know, think of it as *test* data for the network engineers. :-(

yes, this is an excellent reference. the first author was a neighbor of mine
years ago! small world!

it is also well and good to point out to the community that there are a
lot of random-noise posts. what i feel is important to keep in mind is
that it does no good to sit back and simply remark on the lack of quality
of the posts - we know firsthand how easy it is for beginners etc. to get
onto a thread in their own language. simply saying "wow, that was incredibly
wrong/funny/stupid" is of no help. what these people (who are obviously
interested and often alert) _want_ is to be helped along.

the question asked in my original post which has not yet been well addressed
is "what are the details of the ss systems used in the 900 MHz cordless
phones." perhaps this was my fault for not having been clear enough.

whatever.

instead of offering any of this information, it appears that it is far easier
to insist that the well-meaning posters, who apparently didn't understand the
question well enough to be of succinct help, are to be "howled" at. this does

no good.

i can imagine that if some poster who had concrete information to offer did so, then any questions regarding basic terminology and introductory material could be referred to at the time they were asked. give the interested the benefit of the doubt and move constructively to address the issue.

how about providing the interested among us with some concrete information which directly gets to the point of the original post: details on the 900MHz ss phones.

1) spreading code generation scheme / rate / utilization.
2) tx/rx frequency pairs.
3) analog digitization rate. mixing scheme.
4) security code scheme. unique to phone?
5) power output.
6) etc.

finally, i want to apologize for starting what probably appears to be a flame war. i promise to be better. also, the three posts happened because the newsreader kept telling me that the post did not go thru. i haven't seen a way to cancel with this reader, yet ;)

While I agree with you that PC use of AX.25 is not the best for distributing
spots, it is, currently, the only game in town. AK1A has something like
400 nodes installed around the world, and they all talk to each other (altho
the email facility comes close to being useless if the mail has to go more
than one hop). Besides, if the network is configured as it should be,
with local users on one frequency and the inter-node link on another, I
am not sure that the amount of bandwidth required is an issue.

CW uses quite a bit less bandwidth than SSB, but I don't think you would
advocate abandoning phone...

I also agree that AX.25 is not the best protocol for sending DX spots but
PacketCluster is an AX.25 application that requires the minimum equipment
on the user end. A radio, TNC, and dumb terminal is the user investment. It
would seem that to implement a more efficient protocol would certainly require
a computer on the user end to sort things out. Some of the OF's barely mastered
getting a dumb terminal to talk to a TNC, it would be real interesting watching
them trying to become computer literate. Hi..

But if someone came out with a system that offered enough advantages over the
current Cluster software, I think it might catch on. There are many problems
with PC that could be overcome by a more robust protocol which would be very
attractive to the sysops. My own feeling is that PacketCluster needs competition
or many of the problems with it are not going to be solved.

2789. New satellite Windows programs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-18 20:10:16 UTC
From: Tom WB7ASR <tom_boza@ccm.hf.intel.com>
Message-ID: <330fuc$ia3@chnews.intel.com>
Source record: 47878
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.digital.misc

I just received my copy of the July/August 1994 issue of THE AMSAT JOURNAL.
In the journal, pages 6-9, they talk about a new Windows PB and PG like
program by ZL2TPO. The program also has a fully intergrated color graphic
world map showing satallite positions and foot prints. It has full support
for the Kansas City Tracker/Tuner, with the optional Windows program by
KC6WYG, on page 10.

Both programs can be purchased from AMSAT direct for $40.00 @ 301-589-6062
All proceeds go to the Phase3D program.

73s, Tom WB7ASR...

>on my HT).

Packet LANS are typically out of touch with their users. One overly rich operator buys a 70 watt amp, then everyone else buys one. Then some idiot with too much money buys a 140 watt amp, then everyone else on the frequency has to also. Although arms (amps?) races like this occur on HF, etc, its far more signifigant in the hidden transmitter filled packet world.

I hate being the hidden transmitter also!

Theres no point in creating HUGE frequency service areas that require at least 75 watts into a good antenna 50 feet up. This is the situation in my area and it is killing packet here. I am only spending my money on my 14400 baud SLIP internet connection now, (one $79 modem) and not my antique 1200 packet system ($200+ radio, $100 antenna sys, $110 TNC, $100+ amp, total more than $500 for #@%& 1200 baud). I simply can't afford both.

Most non-hams who could get into packet are sharply turned off when I tell them it only takes $500 to get started with 1200 baud. They know they have a $75 14400 modem in their computer and landline services are far far better than anything on packet.

How is a new guy supposed to get started, and WHY should he? I never would have if I knew what I know now. Read this months QEX for other cheerful thoughts.

>I ownly do my BBSen on the wa6ham bbs in pittsburg cal. I like to set a goal on how far
>I can go on the net in a single night. so far colorado springs is the
>farthest west I've gotten,

Its impolite, but, ignore the complaints about node DXing. Your noding is probably not the worst application of packet that exists. Look at some of the bulletins being forwarded that you "interfered" with for an example. Your DXing is a harmless waste of bandwidth, just like all other DXing, and should be encouraged, not flamed.

> 'm trying to get back to St. Joesepg mo. I
>have family there.

I have incredible use for node DXing also. I have family abt 5 nodes north and a few friends a couple nodes west.

Although a few nodes drops rates to possibly below my 5 wpm CW speed, that is faster than email store and forward.

The keyboard to keyboard frequency is pretty weak, so I sometimes need to use the nodes on the BBS frequencies, much to the probable dislike of board operators. The fact that I'm kind of crystallized onto the BBS frequency doesn't help.

You *can* get connections to Inet.. it certainly isn't very reliable though, and it is only in limited areas.. not widespread. If you want Internet access everywhere, you can get SLIP through (I think) 1-900-CERFNET... something like that.. 8-). Basically, use X.25 or long distance I guess 8-). That'd be nice if a organized packet network for that appeared eventually but it's not there yet 8-).

>filled packet world.

People like me are a problem, too. I live in somewhat of a 'fringe'
area. No matter what, I'm out on the edge of the coverage area. I
am, therefore, a 'hidden' transmitter in the very correct sense of
the word... ...not enough of the other bases can hear me, so that
they don't transmit. And vice-versa.

My most reliable link is into a node where it comes back to me at
about S3. There is a node that is S9, but it is too heavily used
from the 'other side' of the coverage area, and I just get lost.

Add to that that all of the really strong nodes in my area (dead
center New Jersey, Morris County) have for some odd reason decided
to camp on 145.01.

What we have here is a mess.

And it's not because the frequencies are incompently chosen, from
the perspective of the folks who are central to the nodes.... ....for
them it makes sense and works. It's only around the fringes that its a
problem. Which raises a point about packet networks. What is glorious
and perfect at one QTH may be an utter mess from another!

From where I sit, I hear traffic from Westchester County, NY, all
the way out to Bucks County PA! All on 145.01. By contrast, the
other packet frequencies are very quiet.

If we're to reduce collisons and give a wide, flat, coverage area,
the big switches need to diverge a bit in frequency. In the SF
Bay Area, I was used to finding a switch on every major packet
frequency, sometimes the same switch. That spread the traffic away

from 145.01.

IMHO that was a Good Thing[TM]. Of course, we also had the advantage
of living in a bowl surrounded by good radio sites!

Greg

Yes you can. I don't know how many gateways are setup for this, but I know of one is n0ary.#norcal.ca.usa.noam, also known as bbs.arasmith.com on internet side. To send a note from internet to packet you must first register (free, just links your callsign to your email address) by sending a note to: gateway-request@arasmith.com containing the following:
call:
name:
city & st.
zip:
homebbs:

You must send this note from the email address that you will use to access the gateway. The gateway-request will take your callsign and the email address from the "from:" line.

You can also send bbs commands to access the packet bbs via email. Send a command file to cmd@bbs.arasmith.com.

To send email to a packet user, address to <callsign>@bbs.arasmith.com or <callsign>%<packet_site>@bbs.arasmith.com.

2798. Radio Shack TRS-80 Model 100 for Packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-19 20:20:57 UTC
From: aa642@FreeNet.Carleton.CA
Message-ID: <Custux.8Fv@freenet.carleton.ca>
Source record: 47793

I use packet on my 386 computer with an ASA PK-88 tnc through my Realistic HTX-202 handheld 2 meter radio. I would like to try operating portable packet. I have been offered an old TRS-80 Model 100 computer with manual I am told is in good working order.

My questions are:

1) Is this rather old computer suitable for portable packet?
2) the model 100 has an rs232 port -- do I need any other hardware or can I simply connect my pk88 directly to that port?
3) Will the communications software in the computer work satisfactorily with the pk88 tnc?
4) the model 100 runs at 300 bps through its internal phone modem, what speed can I expect to operate the tnc via the rs232 port?

Thanks for any help you can provide.

Unfortunately, no. Standard modems use a fixed set of frequencies that are okay for phone line use, but really suck for use over radio. There's also the electrical problem.. they expect to get a line all to themselves, and get a dialtone first 8-). Also, they would most closely match I guess a really fast RTTY mode. Ham radio uses packet (where the thing needs to pick up other stations and not rely so much on a carrier signal...) Fax modes, etc., which modems simply aren't set up to do. Oh yeah, my modem only allows like 2% (or is it even that much?) from the tones it is set up to detect.. packet radio stuff general expects a good amoun of drift and general crappy conditions. For ont much more than the cost of a 14.4K modem, you can get a 56Kbps packet controler, though. I don't a 56K controller'll do standard down to 45.5 baud RTTY though.. a TNC to do that can be gotten cheaply too.

Source record: 47795

I am interested in any one's experience with the X1J/2 node firmware. I have been trying toget it going and have been having troubles with it. (Operator trouble) My understanding of the parameter settings for basic operation (no other ports) is some what limited.

The copy that I have did not have the help file included for the HELP command. I will have to generate one from scratch. Any suguestions?

I have not figured out the SYSOP command or it doesn't seem to be working. Maybe I have set up the E-Prom improperly.

I would be much appreciative of any help using this thing, so I can get it straight before putting it on the 'hill'. Any information on where I might get more detailed information would help. I will look here for help or you can E-Mail me direct.

Thanks.

In article <3306v8$jbi@vixen.cso.uiuc.edu> k9cw@prairienet.org (Andrew B. White) writes:
>While I agree with you that PC use of AX.25 is not the best for distributing
>spots, it is, currently, the only game in town.

Note that broadcast servers us AX.25 too, just UI frames instead of
connected mode frames. The FCC has us locked into AX.25 wrappers for
unattended third party use.

>AK1A has something like
>400 nodes installed around the world, and they all talk to each other (altho
>the email facility comes close to being useless if the mail has to go more
>than one hop). Besides, if the network is configured as it should be,
>with local users on one frequency and the inter-node link on another, I
>am not sure that the amount of bandwidth required is an issue.

While splitting the users off the backbone is essential to making the
systems work well at all, it *does* increase the amount of bandwidth
the systems tie up. The real problem is that connected mode bulletin
distribution uses nearly 26 times the channel capacity of a broadcast
server. That means in practice, at our current low channel speeds, that
channels have to be *dedicated* to Packet Cluster activity rather than
being timeshared with other packet uses. That's bad spectrum utilization.

Of course faster channel speeds can help, and I note with approval
that Packet Clusters seem to be among the first to embrace faster
channel speeds (out of necessity), first jumping to 2400 baud and
now going to 9600 baud. But that's only a less than 2 and less than
9 increase in channel capacity respectively at best (actually much
worse than that on a simplex frequency due to turnaround and overhead
delays). But a simple change to a broadcast protocol would *immediately*
give a nearly 26 fold increase in available channel capacity. Since it's
only software (heh), the change could be relatively quick and painless
too.

Note, broadcast use would free up channels only by allowing more
than 26 stations per cluster. The channel would still have to be
dedicated to the broadcast server. But the server could also serve
more than just DX spots with the excess channel capacity. It could
also distribute other types of bulletins and files in it's idle
time.

I don't think most connected mode servers are a good use of packet
resources any longer. Broadcast servers are so much more efficient
that Cluster *and* BBSs should change over as rapidly as practical.
There remain some cases where connected mode works best, like serving
low density WANs that need digis to get coverage. For higher density

areas, however, the broadcast server is very much superior for most uses. (Personal Email may remain an exception.) Perhaps we need to think about making broadcast the bulletin and file distribution default, and connected mode the exception, in future server designs.

I'll repeat, broadcast servers use an AX.25 wrapper too. It's just a UI
frame instead of a connected mode frame and acknowledgement.

As for the OFs with dumb terminals, I suspect they are the exception.
Dxers generally want the newest and biggest toys. Even the old guys
use logging programs, propagation prediction programs, etc. It may
have taken them longer to become computer users, but many of them
have overcome their fear of the unknown and pushed ahead rather than
watch their spot on the Honor Role slip.

>Can someone point out the difficulties to me or give comments on
>the idea?

This is a Frequently Asked Question. The answer is that if you have a modem that can do Bell 202 (not 212) *half duplex* without need to negotiate a connection, and if you can do the HDLC and AX.25 in software on your computer, then yes you can use your phone modem. In fact, it was availability of surplus leased line Bell 202 modems that made packet originally take off. However, such modems haven't been made in at least 10 years, more like 15, so it's unlikely your modem can do the job.

>
>My questions are:
>
>1) Is this rather old computer suitable for portable packet?

Yes indeed. The only problem is the 40 column lines. Most packet is
formatted for a 80 column screen, so lines wrap and make formatted
messages look funny.

>2) the model 100 has an rs232 port -- do I need any other hardware or can
> I simply connect my pk88 directly to that port?

All you need is a RS232 cable.

>3) Will the communications software in the computer work satisfactorily
> with the pk88 tnc?

Yes.

>4) the model 100 runs at 300 bps through its internal phone modem, what
> speed can I expect to operate the tnc via the rs232 port?

The TRS100 will support faster speeds on it's serial port. I don't
recall exactly how fast it will go, I sold mine a while back, but
I'm sure it'll do 9600 and maybe 19.2 kb.

The Mod 100 is still a good portable packet terminal because of it's
excellent battery life and relatively small size.

Have you checked out the NOSintro Book by Ian Wade? It should get you started. The ARRL had some copies on order back in Jun. Don't know what there status is. 350+ pages of text and illustraitions for $25 is a good bargin.
Also... you should see what version of NOS others around you are using. I think it's always best to start off with what others are using so you can get local help from them.

> Also, I have tried putting my PK232mbx into
>KISS mode and cannot seem to get it to work.. Turning KISS ON or with

Some TNC's... go into kiss mode with the command KISS ON and nothing else. Once your in KISS mode, your TNC is going to appear to be 'hung up'. You won't be able to enter commands from the keyboard. You might just want to do what your doing and then start NOS. GL.

1200 baud below 50MHz for amateurs. For commercial use quadrature phase shift keying with reed solomen error correction and FEC combo is said to deliver 4800 baud over a good channel but in practical applications 2400 is about the best you can get.

2817. 9k6 with Icom IC04 ?

Steve Diggs
East Atlanta LAN

---------- Cut Here ------------

For the 475 simply connect to the discriminator output on the accessory jac on
the back of the rig. For the 271 see below:

9600 BPS PACKET MODS FOR IC-271/471
by Mark D. Johns, WA0RGV

Operation of high speed packet requires that special modems be
incorporated into the Terminal Node Controller (TNC) and that these
modems be connected to the radio(s) at points which by-pass pre/de-
emphasis and audio circuitry. This is easily accomplished on the
Icom IC-271 and IC-471 series by using the CTCSS unit modular
connectors on the Main circuit board of each radio.
To gain access to the Main board, remove the top cover of the
radio. As the front of the radio faces you, the Main board is the
larger circuit board on your left. It can be readily identified by
the control potentiometers for CW Delay, VOX Delay, VOX Gain, Anti-
VOX, and CW Monitor volume which are mounted on this board near the
front of the radio.
To find the discriminator audio output, orient the 271 or 471
so the front panel is facing toward you. Look along the left side
of the Main board, just slightly forward of mid-way, and locate
J14. It is just behind IC-14, the discrimintor, and slightly to
the left of the metal shield over L18. The pin of J14 toward the
edge of the Main board is the discriminator output, the pin toward
the center of the board is ground. A shielded cable can be
connected here and routed to the accessory jac, if your radio is so
equipped.
If your 271/471 does not have an accessory jac, remove the
cover over the accessory jac punch out and install a Radio Shack
12-pin female polarized interlocking connector (part #274-242) in
the punch out. Use the matching Radio Shack plug (part #274-232).
The connection to J14 does not have to be soldered. Use of a .1"
spacing 2-pin female header will make it possible to remove this

modification at any time.
If your 271/471 is equipped with the optional CTCSS decoder,
it should be possible to connect both the decoder and the packet
modem without switching back and forth (but I have not tried this).
To find the varactor modulator input, again orient the radio
so that the front panel is facing toward you. Look for a large
bare spot among the components on the board, just slightly to the
rear and to the right of dead center. On the right edge of this
open area, locate J12. The pin of J12 toward the front panel is
ground. The pin of J12 toward the rear of the radio connects to
the varactor through R271, and 10k resistor. J12 will have P1 of
the CTCSS encoder board connected to it. This may be left in place
without difficulty (just be sure the Tone switch is set to "OFF"
when running packet!!!). You may again attach a small shielded
cable here and route it to the accessory jac or your substitute.
Some packet modems will require an impedence matching
capacitor to be placed in series between the modem and the varactor
feed point at J12. This value will have to be determined
experimentally. Users of early version PacComm 9600bps modems
report using a value of 1mfd at this point. Later versions of the
PacComm 9600bps modem already have a 1mfd capacitor in series with
the output line inside the modem, and a much smaller value is
needed. A .05mfd non-polarized capacitor may be a starting point
for your experiments.

Remember baud != bits/second ... Hams can use PSK too. As I recall Clover
can get up to 4800 bits/second under good conditions.

Robert J. Raymond (bobr@on-ramp.ior.com) wrote:
: I could sure use some help in getting started on TCP/IP!
: I have various versions of NET, NOS and BM and none of them seem to
: work with each other..

Virtually all the versions of Nos, NET, and BM use the same directories and files to start up. One of the fellows over here in the Seattle area has put together a disk with an installation script. If you mail your address to me, I'll ask him to mail you a copy of the disk. It may help get you started. One of the important differences that I expect to occure between here and there is that for routing outside the stations you can work direct, you will probably have to use NET/ROM for linking. In the Seattle area there is enough TCP/IP activity that we've been able to build our own network for routing TCP/IP packets. Using NET/ROM may require you to get the cooperation of the local NET/ROM (TheNET, etc.) operators so you can route via their nodes. I think this has been a political problem in the Spokane area in the past, so approach with caution.

: Also, I have tried putting my PK232mbx into
: KISS mode and cannot seem to get it to work.. Turning KISS ON or with
: latest firmware I have KISS $01 results in TNC hanging up..not able to do
: a restart.. Is there something wrong with my TNC?

No. The PK-232 (and all AEA designed TNC's with firmware newer than 12/88) are supposed to work just like this - when you het the enter key at the end of the command, the TNC went immediatly into KISS. You can get the TNC out of KISS (or TRANSPARENT or HOST) by sending 3 (and only 3) Control-C characters to the TNC within 1 second - then wait a second. You should then get a cmd: prompt. Make sure that you have the TNC TBAUD and the attach command in your autoexec.nos set for the same baud rate, otherwise the software and TNC won't understand eachother.

: Thanks for any help offered.

: Bob, KG7WC

One of the other respondents mentioned the NOSINTRO book by Ian Wade. This is an excellent resource! It teaches you how to bring up nos, with lots of examples, including the NET/ROM configuration issues. If you can't get a handle on NOS in the next week or so, I'd suggest you aquire this book.

: Eureka! I've been anxiously waiting for someone to take this one on. Can
: you tell us more, Bob?

: Todd, KB6JXT

At the moment, not a lot. I think there may be some alpha code on
ftp.ucsd.edu. Take a look on there. I'm planning to use Linux for my packet
front-end, so this is not a high priority interest with me.

You might want to get on the NET-SIG mailing list - as I recall, this is
where it was mentioned. Try sending mail to:
'net_sig_subscribe@tcet.unt.edu' with a subscription request and your email
address in the text. If that fails, drop a note to 'tapr@tapr.org'.

In article <3383g2$jcf@merlion.singnet.com.sg>,
ianheng@merlion.singnet.com.sg (Ian Heng 9V1XA) writes:

>Could someone please tell me where I can subscribe to Packet Radio
articles
>on Listserv nodes.??
>Thank you for your help.

Try this:

listserv@ucsd.edu

Subject: <blank>
Text: help

In a nutshell here is the help file:

You can subscribe or unsubscribe to any of the various campus mailing
lists and the local redistributions of global mailing lists by sending
email to "listserv@ucsd". The commands understood by the listserv
program are:

HELP
lists this file. This is also sent whenever a message to
listserv is received from which no valid command could be
parsed.

HELP groupname
lists a brief description of the group requested.

INDEX
lists all the groups available for subscription.

LONGINDEX
lists all the groups and their descriptions.

ADD listname
DELETE listname

ADD address listname
DELETE address listname
adds or deletes the given address to or from the list
specified. Mail is sent to the address given to confirm
the add or delete operation. We strongly recommend that
you use your campus registered mailname when subscribing
(i.e., use the second form of the command which includes
a specification of the address). If you omit the 'address'
the command will assume the mailbox that is in the From:

line of the message. Note that SUBSCRIBE is a synonym for
ADD; UNSUBSCRIBE for DELETE.

DELETE-ALL
UNSUBSCRIBE-ALL

DELETE-ALL address
UNSUBSCRIBE-ALL address
unsubscribes given address from all mailing lists. Mail is sent
the address given to confirm the deletions. If you omit
the 'address' the command will assume the mailbox that is in
the From: line of the message.
LIST

LIST address
lists all mailing lists to which the given address is subscribed.
If you omit the 'address' the command will assume the mailbox is
in the from line.

FAQ

FAQ listname
sends a list of "Frequently Asked Questions" for the appropriate
mailing list. The command "FAQ" by itself sends an index of
available FAQ's.

INFO

INFO filename1 filename2 ... filenameN
GET filename1 filename2 ... filenameN
sends a copy of the appropriate information sheet associated
with each file name. The command "INFO" by itself will send
an index of available info sheets.

FAX faxnumber filename1 filename2 ... filenameN
sends a fax of the appropriate file to faxnumber. Faxnumber
is the phone number of the desired fax machine, including
any necessary dialout prefixes. Fax machines on UCSD's Ericson
telephone system are best accessed using their 5 digit extension.
The command "INFO" by itself will send an index of available
documents.

A command must be the first word on each line in the message. Lines
which do not start with a command word are ignored. If no commands were
found in the entire message, this help file will be returned to the
user. A single message may contain multiple commands; a separate
response will be sent for each.

Please note that is IS possible to add or delete someone else's
subscription to a mailing list. This facility is provided so that
subscribers may alter their own subscriptions from a new or different
computer account. There is therefore some potential for abuse; we
have chosen to limit this by mailing a confirmation notification

of any addition or deletion to the address added or deleted including
a copy of the message which requested the operation. At least you
can find out who's doing it to you.

Examples:

add sunusers

add ewombat foodlovers

delete wombat@cyberpunk.ucsd.edu connectionists

help eggbeaters

Note that although you would mail submissions to a campus mailing list by
addressing mail to e.g., sunusers@ucsd.edu, in a subscription request
you specify the name of the list simply (without the @ucsd part) as in
the first example above.

2831. Anyone running TPK with a KPC-3?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-22 01:26:01 UTC
From: johnmxl@aol.com
Message-ID: <338ur9$t5u@search01.news.aol.com>
Source record: 47825

Hi...
I have spent the better part of the weekend attempting to get TPK v1.81 running on my packet station. I am running an XT and a Kantronics KPC-3 TNC. I have gotten it to do auto-forwards OK, but it still isn't picking up the message header list (even after 6 hours of continous operation).

I based the config.tpk file on the KAM files included, but I know some of the commands work a little different between the dual-port KAM and the single-port KPC-3.

Any help from hams already running this combo would be appreciated, including config.tpk suggestions, and/or troubleshooting hints.

Thanks a lot....

How much money do you have?

You can go military type equipment and get 4800baud or better

My company (Codan Pty. Ltd.) does 2400 baud, Spilsbury do 1200 baud and the closest anything else comes to my knowledge is Clover II at 750 (?)

Of course I'm ignoring all those 1200/600 baud VHF/UHF contraptions that pass themselves off as being suitable for HF.

If you've got several grand, you can have a couple of my 2400 baud jobbies

FOR SALE:

Yaesu FT-290 RII 2 Meter All-Mode Transceiver
- DTMF Microphone
- 25 Watt Amplifier
- Mobile Mounting Bracket (never installed)

This rig is in perfect condition. I purchased it for
the Spring VHF Sweeps and have used it about 6 times
since then. The receiver section and audio on this
rig are excellent, and the SSB is exceptionally sweet.

Unfortunately I must part with it for financial reasons.

The first $450 takes it away.

2844. Re: HELP..TCP/IP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-22 17:58:45 UTC
From: sehrlich@dogbert.dac.neu.edu
Message-ID: <33ap0l$cns@dogbert.dac.neu.edu>
Source record: 47839

To get into TCP/IP packet, you will need to do the following:

1) Ask hams in your area what TCP/IP stations are operating in your area, and on what frequencies those stations live on; also ask who the IP address coordinator for your area is, and how to contact them;

2) Try to connect via a normal AX.25 connection to those stations. Whichever one you can connect to the easiest is the station you should stick with and remember;

3) Ask your IP coordinator for an IP address based on that IP station your were able to connect to.

4) Grab a copy of NOS (I like JNOS, available via anonymous FTP in ftp.uscd.edu:/hamradio/packet/tcpip), and ask a friend already on TCP/IP for a copy of autoexec.nos, the file which tells your NOS program all the settings it needs to know.

5) If the person who gave you the autoexec.nos file didn't customize it for you, you will need to edit it to add your IP address and hostname.

Now, getting back to the KISS thing. Once in KISS mode, if you have a working copy of autoexec.nos, and you start JNOS, you can tell your TNC to go back into AX.25 mode with the command 'param ax0 255' or something similar, depending on your TNC.

Or, if you prefer, you can perform an AX.25 from within NOS by typing 'connect ax0 station_you_want' AX0 is the "interface" name, or, simply, tells JNOS what port your TNC is connected to (an alias for the com port).

When all else fails, there is a jumper in most TNCs which can disable the battery which keeps your info stored in your TNC's RAM. Once you remove the jumper, you wipe out all the info (parameters) stored in its RAM, and go back to AX.25 mode. From this point, you can perform normal AX.25 communication again.

Hope the above helps.

73,
Scott

An 80 column VT100 emulator does exist. It only shows 40 columns at a
time, but it might help you out. It was on one the ftp sites on the
Internet as vt100.bas and vt100.doc

>>4) the model 100 runs at 300 bps through its internal phone modem, what
>> speed can I expect to operate the tnc via the rs232 port?

>The TRS100 will support faster speeds on it's serial port. I don't
>recall exactly how fast it will go, I sold mine a while back, but
>I'm sure it'll do 9600 and maybe 19.2 kb.
>
One minor nit here... The TRS-100 and TRS-102 will only print to the
screen up to about 400-600 baud. The laptop's serial port will communicate
up to 9600 (or 19200) as long as you aren't using the LCD screen.
(For example, doing a file transfer with a PC using some terminal program.
You download to a file and don't print to the screen hence you can go fast.)

The Tandy 200 laptop (with the 16 line screen) can handle
up to 1200 baud when writing to the screen. If you try to run the
serial port above these rates (while updating the screen) you
will either start losing characters or you will see your actual
throughput drop to the screen writing speed (depending on flow control).

Hi Steve,

If the Mastr II is one using a PLL exciter (only adjustments are xtal freq, deviation, and an inductor near the back of the board) then all you have to do is inject TX audio right into the audio input pin on the TCXO. If you are building a repeater, you will probably want to modify the PLL so that it runs all the time. If I recall you have to jumper power to the board that is normally switched by the PTT, then use the PTT signal to turn on and off one of the later buffer amps in the exciter. I've done this, but it was about two years ago, and (by the way) the repeater has been running continiously since then. Only troubles are caused by our low-budget startup - we didn't invest in having the TCXO temperature compensated to the crystal, and the repeater is on a 5000' mountain. During the cold weather, it was necessary to send lots of data to the hill (pings) to get the machine warm enough repeat packets decently. We are using the TAPR 9600 modem on this system.

If the Mastr II is one of the conventional design exciters, it is probably very similar to the MVP and Exec II mobiles. Our group has modified a whole bunch of MVP's. The TX mod is to apply modulation through a 2.2k resistor directly to the varactor diode on the channel element. This takes up to 6 volts p-p to get proper deviation, so either a buffer amp is needed, or the output buffer on the modem has to be modified. We've done the latter to a number of the TAPR modems.

The receive mods can be done two ways. This appears to apply to all the GE Mastr II's, MVP's, and Exec II's, as they use the same board set for the receiver. On the IF/detector board, you can either 1) tap right off the audio out pin of the detector chip, or 2) take the RX audio off of the board output and remove all the caps in the 3-transistor amp stage between the detector chip and output that affect frequency response. The latter is reccomended to give a little more signal level for the modem to work with.

Hope that gets you headed in the right direction.

I am in the process of examining the possibilities of using HF packet to provide communication between my sailboat while at sea and land based e-mail connections. I have been a ham since the late 70's and have been inactive for some time. Suggestions of what kind of gear (HF rig, TNC, computer) would be very helpful. I will most likely be loading the backstay as an antenna.

Also, I am trying to decide between Intel based PC's and the Mac portables (something like a 540 active monochrome in the mac line or a 486 33mhz laptop in the intel world).

Message-ID: <33bjgt$3b8@vixen.cso.uiuc.edu>
Source record: 47745

In a previous article, gary@ke4zv.atl.ga.us (Gary Coffman) says:

>While splitting the users off the backbone is essential to making the
>systems work well at all, it *does* increase the amount of bandwidth
>the systems tie up.

But if we move these users to another band (222/440/900 or whatever) we can
re-use the bandwidth, and accommodate the current users given current
equipment.

I am confused about how the broadcast server works. Does each end-point
periodically transmit a poll to see if any messages were missed? Or is
the assumption made that every end-point receives every broadcast error
free? With UI frames, does each end-point "guess" whether the broadcast
was from the broadcast server base on what can be recovered from a
corrupted frame? Does the broadcast server continuously repeat the last
N spots?

PacketCluster presently provides more than just spot information,
but the DX spots are the most important. Without the ability for each
end-point to confirm receipt or request fills, it seems to me we have no
better a system than the old 2m voice net (actually not quite that bad) or
the 2m Baudot net we used to use in the 70's. If fill requests do not
occur on the broadcast frequency, then we need a second channel for
email transmission, listing old DX spots, searching the callbook, etc.

How would that work with the broadcast server?

2851. Can packet radio do point-to-multipoint HIGH speed IP?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-23 01:46:32 UTC
From: rumbo@bronze.coil.com
Message-ID: <33bkdo$25i@bronze.coil.com>
Source record: 47747

I need to send IP packets over the air at high speeds (Ethernet speeds -10Mbps or close). The ketch is I need to use one transmitter to broadcast/reciev from multiple points. As you can see I am new to packet radio so as much detail as possible would be appreciated!

- Thanks!
please call me at 614-766-7780 so I can call you back (cuz of the lond distance so that we can discuss this application of packet radio. I say once again - I am new to packet radio and I need all the help I can get :)!

Source record: 47746

Chris,
Are you sure that 741 is O.K.? If it is you should measure 0.00 volts
accross the input terminals. To clarify what the other respondent said:
Connect R1 from ground to the INVERTING INPUT.
Connect R2 from the INVERTING INPUT to the OUTPUT.
Connect your input signal source to the NON-INVETING INPUT.
That's it! If the input goes to -11 volts it means the op-amp isn't in a
closed loop and the negative input exceeds the positive by even a few milli-volt
Volts!!

Good Luck..

Gary, I assume then that you favor the discontinuance of using TELNET and FTP on top of TCP/IP in favor of a broadcast or multicast equivalent?

The big problem I see with "simply" replacing the use of connection-oriented packets with UI frames for DX clusters is one of reliability. Packet is an extremely UNRELIABLE data link. That has to be factored in to any change which is made. There's nothing wrong with running over unreliable media, you just have to account for that in higher level protocols. At some point in the stack you must acknowledge frames, or recognize (in the broadcast case) that you've missed frames, and ask for repeats.

How is the PacketCluster machine to know that the UI frame with a DX spot just got stomped by another station starting to transmit a frame? Packet radio does NOT run with Collision Detection in the way that Ethernet does. You cannot tell, when transmitting, that your frame has just gotten munched.

Hello all! I am in IMMEDIATE NEED of some Motorola
walkie-talkies. I am looking for either Motorola HT-600,
MT-1000, or Motorola Radius P200 units. They must be 5 Watt
units and have at least 6 channels and must cover the 157-174 Mhz.
range. I am also interested in accesories for these units, such as
speaker/microphones, headsets, etc. Let me know what you have.
WILL PAY CASH or can trade for hardware and/or software items
from my ads. Leave message here or give me a call.
Darryl Linkow
(818) 346-5278 9 am - 5 pm PDT

There's a good article in QST regarding exactly what you are asking
about, this month. Look at the AEA PK-232, the Kantronics KAM, to start;
these are far and away the most popular TNCs.

Except for the TNC, which isn't all that expensive, you have everything
you need to get going! Digital is great!!

From: jwill@cabell.vcu.edu
Message-ID: <1994Aug24.134642.18853@cabell.vcu.edu>
Source record: 47755

Has anyone had any success using a Baycom type modem with the HP 100LX palmtop? Before I go out and mess with it, it would be good to know if it is possible or not. The Hamcom interface I built wouldn't work with the 100LX serial port, and so I am now skeptical and would like some reassurance before I invest in the parts to build an interface for Baycom.

Just go buy a KPC-3 works good tastes great.
Seriously I used to use a Baycom from Tigertronics.
It is a memory hog and likes power. I don't
think the added cube of the KPC-3 is enough to
warrent the hassle of the Baycom. The KPC-3 runs
forever on a lithium 9V battery. My mobile com
program is a freeware item called pax. The only
real advantage of the Baycom and associated software
is the lower box which shows all packets received
so you can sniff the call of a local BBS when in a
new area. You can do this with 'passall' and 'trace' with
other modems. Pacom also makes a pocket sized modem
with a nicad internal however I have spent a great deal of
time trying to get there stuff to work and am not yet
impressed. Hope this helps. When you get on packet de

"...MUCH software available for it..." but what about the difference between Quality and Quantity? Just how many word processors, terminal programs, spreadsheets, etc, is enough? Sometimes more choice means more choice among better products, but not in this case. The best PC/Windows software are ports from the Macintosh. I recommend you choose a Macintosh, I did 5 years ago and love it.

Unless there is some reason you CAN NOT use a Macintosh, a Macintosh will never bother you about video drivers, video modes, mouse drivers, "real" mode, AUTOEXEC.BAT, CONFIG.SYS, Extended Memory vs. Expanded Memory, memory managers, HIDOS, IRQ conflicts, CD-ROM drivers & cards, sound cards, and the magical 640k limit.

You would not want a Macintosh if there is one particular software package you need to/have to/want to run. One of the things I do at work is write software for embeded 68HC11 based systems, on this Macintosh. The editing and compiling environment on the Mac is the best that can be found anywhere. I use the same Mac to draw the embeded system's schematics, layout and autoroute PCB's, parts lists, documentation, everything except in-circuit emulation. The Nohau emulator is hosted on a PC, as is my EPROM

programer.

Additionally, (at least with the Powerbook 180) the accessory video port may drive either a second monitor, or a copy of the LCD. The difference is when you have a second monitor, both the LCD and monitor are running at the same time and your "desktop" is expanded to the sum of the 2. The mouse slides right off one onto the other. If you want to see a big drawing, just stretch it across both monitors, the Mac's operating system will take care of it, the application doesn't have to know. PC's can not begin to do this. Macs support up to 6 monitors at once. I'm using a 21" 24-bit monitor, a 19" 1-bit monitor, and a 14" 16-bit monitor on a Macintosh IIvx. No video drivers. No jumpers. No hassle.

On the other hand, Unix is often chastised for being obscure, complex, and difficult to maintain while I've found Unix to be much easier to maintain than PC's, MS-DOS, and Windows. And a PC running Unix presents the worst of both worlds. Rarely does a Mac run Unix, but it can, and DOS also, at the same time.

I have looked around quite a bit and about the only software that I have found that supports the FAX and SSTV modes for the MFJ1278 is MFJ's multicom program.

The HP100LX works fine once the Baycom is powered by a 9 volt battery.
Works even better with a PacComm HandiPacket and MSYS. With that it is a
full forwarding BBS with all the goodies (node, etc.). In that way
I can forward to the home BBS when I have mail to deliver and the home
BBS can forward into me ... if I am there or not. We also ran it with a
GTOR and Pactor port when running on a battery up in Algonquin Provintial
Park. Worked great and saved all kinds of amp-hours as I didn't have to
use the other laptop.

I love it!

2872. 1200/9600 Packet TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-25 07:54:00 UTC
From: donald.davis@moondog.com
Message-ID: <172.1173.uupcb@moondog.com>
Source record: 47782

Any suggestion on which 1200/9600 packet modem is the one to get? What would one do with 9600 baud packet at this time?

I already use a Baycom BP-1 for 1200 baud packet. I wonder what upgrading to a dual speed packet tnc would do for me or what options I would have with a dual speed tnc?

. CMPQwk 1.4 #9206 . I still miss my ex-wife, but my aim is getting bet

2873. FT5200 and 9600 Baud

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-25 09:05:21 UTC
From: peterm@elec.gla.ac.uk

Source record: 47766

Hi. I have an 18 month old FT5200 and would like to use it for 9600
baud packet. Does anyone have experiences and suggestions?
Please reply by e-mail and I will post summary.

2874. Packet Routing with JNOS 110f

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-25 11:51:22 UTC
From: mercer@dgs.dnd.ca
Message-ID: <33i0jq$d6t@netfs.dnd.ca>
Source record: 47767

I want to use JNOS as a packet switch between an AX25 serial link and an ether net segment.

With the autoexec.nos listed below, I can ping machines on the 1.0.0/24 (ethernet) side of the net and I can ping machines on the 1.0.1/24 (AX.25) side of the net. The problem I have is that if I try to ping say 1.0.0.45 from 1.0.1.99, the packets dont go anywhere. The default route on my AX.25 machine is set to:

route add default sl1 1.0.0.99

The way I figure it, 1.0.0.99 should see the ping for 1.0.0.45 from 1.0.1.99 and route ot from the AX.25 side out onto the ether net side but this isn't hapening.

Is there something I'm not doing right?

By the way, don't get upset about my IP numbers. None of these nets are connected to anything and just exist on an experimental test bed.

```
------------------------AUTOEXEC.NOS for 1.0.0.99------------
## ip setup
ip address 1.0.0.99
hostname dave.ards.dnd.ca.

## ax25 setup
ax25 mycall dave
ax25 bctext "ARDS testbed Daves Machine"

## attach interfaces
attach asy 0x3f8 4 ax25 sl1 1025 768 9600
ifconfig sl1 ipaddress 1.0.1.99
ifconfig sl1 descr "AX25 Connection to Laptop"

attach packet 60 lan1 100 1500
ifconfig lan1 ipaddress 1.0.0.99
ifconfig lan1 descr "Packet Connection to DLAEEM"

## Start Servers
start ax25
start ftp
start telnet

## Routing
route add 1.0.1/24 sl1
route add 1.0.0/24 lan1
```

```
ip hport sl1 on
ip hport lan1 on
ax25 hport sl1 on

>has just gotten munched.
>

It's not that difficult : most broadcast protocols work on a NAK-only
scheme - clients of the server respond only when they miss a packet,
and the server than retransmits it.
The method of detecting that missed packet varies, but a popular method
is to number the transmitted packets and complain when a hole appears in
the number sequence.

This has some difficulties for a DX-Cluster style service : as I understand
it (I don't use DX Cluster) you expect transmissions at intervals, rather
than a continuous stream. Thus, you wouldn't know you missed one until
the next arrived - a second or an hour later. Regular empty packets, sent
just to ensure everyone was up to date, might be sufficent to fix this,
and there are more sophisticated schemes around to ensure this doesn't
itself become a bandwidth hog. These require that the server keep track
of its clients rather than doing pure broadcast, but that's no worse than
having multiple VCs.

However, I think you're correct to be concerned about low reliability of
packet systems - on typical terrestrial packet, the success rate is very
low. As a result, a protocol optimised for the assumption that most packets
get through (and don't require ACKing) might turn out disastrously wrong -
I think a successful broadcast scheme would require both a well-engineered
high-reliability transmission scheme (good paths, no hidden terminals etc)
and a protocol that gets no worse than multiple-VCs even in poor conditions.
It might work pretty well with a full-duplex repeater and extremely well
with a polled hub (where a small amount of reverse traffic can be effectively
free by imposing no additional overhead).

I don't know how closely satellite operation approaches this (do they split
uplink and downlink packet frequencies ?). I'd be interested to hear from
users of the Pacsat broadcast system and even more interested to hear from
anyone who has experimented with a terrestrial broadcast setup.

An <F9> key.

After you have entered "Trace xxxx" <ENTER> (where "xxxx" is the
representation of the type of trace you wish), mash the <F9> key to
see the results.

You can tell if you mashed the key hard enough by observing the upper
left corner of the CRT (3rd line down). It will change from "Command"
to "Trace". Mashing <F9> again will toggle back to Command Mode.

If you wish, you can use other F-keys to sequentially observe multiple
active sessions; <F1> being session 1, <F2> being session 2, etc.
Unfortunately, TRACE does not act like an independent session, and the
TRACE screen will "freeze" if you are watching another session.

Adrian, thanks for your comments, and this is exactly what I was trying
to call out. There are certainly solutions such as numbered packets
which can be implemented. Essentially what you're doing then is to
create another protocol layered atop the broadcast mechanism. It's
not that different from the multicast implementations. I was primarily
pinting out that the "simple" solution that had been mentioned was
not sufficient.

Exactly. The frequency of packets is an issue. It would be necessary to
send out null packets every 30 seconds or so to ensure all stations
received the broadcasts in a timely fashion. Even 30 seconds may be
too long... At some point you really clog the channel with null packets
placed there to ensure naks happen correctly when needed...

From: randyh@gvgadg.gvg.tek.com
Message-ID: <33im06$rdm@gv-gate.gvg.tek.com>
Source record: 47772

I am having a problem getting Graphical Packet to work with a KPC-3.
I have changed the config.gp file to replace NONAME with my call. I
get into the program and it keeps flashing this message window:

V24 data error
PC=A1 Number of try : a number that counts up

Does anyone know of any hints to get this to work with the KPC-3?
Also, does any know where I can find an English manual? Either a
FTP site, or if someone could mail it to me, would be great.

Sorry, perhaps the context was unclear.

I'll try it this way: "There is VERY little CLOVER/AMTOR/PACTOR/GTOR
specific software available anywhere except on DOS/WINDOWS platforms."

We were not talking about word processors, terminal programs,
spread sheets, etc. Were not talking about compilers and linkers.

Were talking about software to provide communications from a boat.
Via HF radio. In some reasonable way.

Happier now?

Hello, I have bin trying to connect a computer running JNOS 1.10d
to an TCP ethernet LAN, without any luck. I'm using an
Novell NE2000 with a Crynwr packet driver. The commands I put
in the autoexec.nos are basically the attach command and few
ifconfig commands, It is based on the WJ7J configuration file
witch I got in a help packet from some ftp site.

The problem is I can't Telnet, Ftp or ping any comuters, witch are
on the same LAN, or other computers on Internet. So It must be
something wrong with the driver or how Im configuring JNOS.

So please if you can assist me in any way,
it would be greatly appreciated

... any autoexec.nos examples would be appreciated.

please post or e-mail.

tnx in advance

Hello parick. glad to see you wanting to get into digital modes. I
have two tnc's that I like very much. I have an AEA PK-232MBX that
works great. It is simple to run, a little awkward at first.It will
do all modes except GTOR. The price runs around $275-300. I also
have a Kam-Plus tnc that I recently purchased. It is more complicated
to run than the AEA. It will do all modes including GTOR. The big
difference between the Kam and AEA is that the Kam will work HF and
VHF at the same time. The AEA will only work one at a time. The
price for it is about $300.00. There is a lot of dx you can get on
hf, and I feel you will enjoy it a lot. It is a little intimidating
at first, though. I will also recommend buying the PC-Packratt II
for the AEA, and the Host Master II for the Kam. Be sure to tell
them it is for a Macintosh computer. Mfj also makes them, but they
don't have all the frills the others do, and the price isn't that
much cheaper. Good luck, and I hope to meet you on Hf sometime.

strace on puts your trace into the F9 session.

trace <interface> <flags> [<filename>] will put your trace into the
specified filename (ex: trace ax0 111 test puts the trace for port
ax0 into filename test).

2888. Packet Routing with JNOS 110f

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-26 01:21:18 UTC
From: jangus@skyld.grendel.com
Message-ID: <777864078snx@skyld.grendel.com>
Source record: 47781

In article <33i0jq$d6t@netfs.dnd.ca> mercer@dgs.dnd.ca writes:

> I want to use JNOS as a packet switch between an AX25 serial link and an
> ether net segment.

radio box:
route add default tnc1
arp publish enet.host ether radio-mycall tnc1

ethernet box
route add default enet radio.host

And wonder of wonders it works!
The key item is the arp publish statement at the radio host.

For example: wa6fwi-3 wa6fwi.ampr.org 44.16.0.141 has a radio on port 144.
no-call net.wa6fwi.ampr.org 44.16.0.205 has only ethernet.
Both boxes call the ethernet port enet.

At wa6fwi.ampr.org it reads:

ax25 mycall wa6fwi-3
route add default 144
this is the default route for all packets
route add net.wa6fwi.ampr.org enet
this is the route to net.wa6fwi only
arp publish net.wa6fwi.ampr.org wa6fwi-3 144
and this tells anyone that it hears calling net.wa6fwi
that wa6fwi-3 will handle the packets for net.wa6fwi

And at net.wa6fwi.ampr.org it has:
route add default enet wa6fwi.ampr.org

There's 4 boxes currently running on the ethernet and several radios on
one of them. One of the ethernet boxes is running SCO-Unix. All the boxes
talk to one another, and can telnet etc out to the "outside" world without
requireing anyone to have "special" routing in their own files.

There are two kits, the 'C26 DSK which is based on the TMS320C26 processor
and the 'C50 DSK which is based on the TMS320C50 processor.

You could say that the 'C50 is the next generation up from the 'C26
in that it has more memory and is faster. Both are fixed point (as
opposed to floating point) processors and will do just about any
DSP trick that you want. Both chips have built-in memory.

The boards are small, approximately 2.5 X 4 inches and have the
necessary A/D and D/A chip (TLC3240).

There is an analog input and output (rca jacks) and a serial connector
(9 pin RS232). You have to supply a 9VAC plug-in-the-wall (Radio
Shack) power supply.

TI supplies a simple Assembler and a Debugger. They also throw in
a loader and a couple of sample programs. No, there is not a
'C' compiler :-)

You connect the 9VAC (notice AC) power supply, attach a cable from
the board to your serial port on your PC and then you can download
or debug programs.

There are quite a few Ham type programs for the 'C26 DSK on the
internet. 'C26 programs can be converted to 'C50 programs with
some effort.

The cost is $99.00. I am not sure what the availability is at
this time (Wyle, Marshall, etc)

If any more questions, Email me.

2890. TCP/IP over packet trough winsock ...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-26 10:55:29 UTC
From: dany@arti.vub.ac.be
Message-ID: <dany.64.000AED17@arti.vub.ac.be>
Source record: 47785

I've just tried the modified Crynwr driver, called ethrax25.
This should allow me to use tcp/ip through windows sockets.
I tried it, and everything seems to start.
I used the latest version of Trumpet winsock, and the latest version
of ws_ftp. If I try the FTP, the TNC does transmit something, but
the trumpet winsock stuff immediatly gives an ARP time out, and
a TCP error. It also stops retrying very soon.
Has anyone got experience with this?

Thanks in advance

dany@arti.vub.ac.be

2891. HF Packet (Mac vs PC)

>dkelly@nebula.tbe.com

Unix also has some "big system" features in it that make it easier to protect yourself from wayward software. I think we've got several unix machines around here that have close to 700 hours continuous uptime (last stop was due to an extended power failure that extended past the UPS hold up time..) The usual Microsoft DOS system has to be restarted several times a day...

I would recommend those with 386 class and higher machines check out OS/2. Get to run your legacy DOS and legacy Windows stuff and have a better operating system underneath. I suspect a lot of "mac" stuff is do-able under OS/2 with the right combination of tools, although the extended screen trick could be a tough one..8). (gee, buy some inexpensive monitors instead of the 1 really expensive big one for folks that need the room...).

|>
|>
Possibly you are correct in watching the term, but it is not broadcasting
in the sense of the ARRL's broadcast of "code practice and such". This
is a network broadcast. It is a transmission to a special address that
can be received by more than one station. It is still usually sent to
some "callsign" (in the IP world that call is usually QST for AX.25). It
also implies that there is no acknowledgement of receipt.
If you are concerned about getting a NAL over this, you had better make
sure that you don't have your TNC setup to do a beacon or even ID itself
regularly as these are the same type of things.

Wondering if anyone has experience using an old (1988) vintage Compaq Portable III computer on packet?

I am worried about noise generated by the gas plasma screen circuitry.

This is an estate sale. I have tried the unit and confirmed that it works just fine. There is no manual available.

I'm assuming the computer is a 286 with maybe 2 megabytes of RAM. Can anyone confirm this or provide more accurate information.

Finally, can anyone suggest a fair price for this unit?

Your help will be appreciated. 73 de Dave NF0R@slacc.com

Bob-
I sent my KPC9612 back to Kantronics today for warranty fix of software
carrier detect. If you have used SW DCD, did you have any problems?
(This would, of course, be only on port 1 - 1200).
The unit is very nice and gets two thumbs up just as my KPC3 does.

2897. TM-733A.DOC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-26 22:39:00 UTC
From: st3qi@elroy.uh.edu
Message-ID: <26AUG199417395520@elroy.uh.edu>
Source record: 47640

Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
August 22, 1994. Release 1.1

This document is a compilation of Internet messages from
Steve Haehnichen KD6RLY and Brad Killebrew N5LJV, edited by Brad Killebrew.

Extended RF Modifications

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically
mounted just behind the front panel wall (which can be removed easily
if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear) are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio. It
will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

The cellular band is indeed missing.

Removing Jumper 1 (B2) ONLY is the MARS/CAP modification. (The green
wire on the left).

DTFM Remote via Microphone

The TM-733 is fully DTMF remotable via the microphone (documented). The radio can also be externally DTMF controllable with an HT, but that will be described later.

The DTMF control keys are exactly as shown on page 81 of the manual. Note that the microphone is active all the time, so any ambient DTMF tones near your mic will also change rig settings. This includes tones coming in on the other band and out the speaker.

Cross Band Repeating

Cross band repeat isn't documented but comes ready from the factory. To enable cross band repeat from the front panel, first select a band by pressing BAND SELECT. Then, change the control to the other band by hitting [CONT SEL]. Next, press [F] for one second, then the "X" button (far right side). Decimals will appear between the Kilohertz digits, and the "ON" indicator will light momentarily. The microphone sequence to enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by turning on the radio with [LOW] pressed. They also recommend enabling the Time-out Timer, for obvious reasons.

DTMF Paging and Squelch

The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with the Yaesu 530 and all Kenwood radios supporting this.

DTMF Monitor

There are some serious bugs in the "DTMF Monitor" feature (Page 63: [PTT] + [DWN] + Power On). This feature supposedly lets you hear the DTMF tones you are transmitting. The first problem is that it only gives you a short tone from the internal speaker. This is not true to the transmitted tone that lasts as long as you hold the key. The much bigger problem is that it mixes the desired tone and the feedback tone resulting in an almost indecodable DTMF tone. Kenwood is aware of this bug.

Front Panel

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think

this means that if I use my front-panel on someone else's radio, I get all my memories and settings. Anyone try this?

The whole front panel is connected to the rig by four wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front panel, and not the unit.

Wireless Cloning

The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:

- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.

Notes:

- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expansion.
- You can not clone between different Kenwood radio models, even if they seem identical.

Be careful when using the clone feature. It has been known to wipe out or scramble memories on the master radio during or right after clone.

Bugs and Problems

To date, I have logged two trouble reports with Kenwood.

The first is the well-known (but still denied) problem with the transmitted PL (CTCSS) tone. The tones are filthy. They contain many harmonics and synthesis noise. I'm guessing this is because they are using 7-bits from the CPU and a resistor net (DAC) to synthesize the tone. The sound/intensity of the noise depends on the actual

frequency being generated. (The PL tones also come out of the radio's speaker while transmitting. Weird, but not a problem.)

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the noise beats with the tone. Go simplex and ask someone to describe the noise to you, or listen carefully to your own speaker while transmitting. Some repeaters do a better job than others of hiding the noise for you.

Kenwood's response to this complaint seems to vary depending on who you talk to. One tech (I wish I would have got his name!) acknowledges the problem, and says they are working on a fix. He guessed that it involves changing a resistor. This would imply (to me), that they are simply turning the PL deviation (strength) down a bit to hide the noise. Unfortunately, this may make the PL less reliable for getting into repeaters. This is not an acceptable fix for me, so I'm insisting that they describe the modification to me before I send the radio in for repair. So far, no luck.

Other representatives will deny that they have heard of the problem. I don't know the cause of this, because it's a well-known and frequently discussed problem among local hams.

The Service Manual specifies a test for the PL. The technician is simply required to verify that any one PL tone is between 500 and 1500 Hz deviation. This is quite a wide tolerance range! The "standard" PL tone deviation should be 750 Hz. Twice that strong might be too strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

Check your PL, and if it bothers you, call them! Their support number is: 1-310-639-7140, and you press [2] at their voice menu to get to the Amateur Radio department (8:30AM - 5:00PM PDT). So far, they have been fairly knowledgeable and responsive, and they always call back the same day if they're busy or stumped. I just wish they would offer a real fix.

External DTMF Remote Control

The following procedure places the 733 in External DTMF Remote Control.

Note that this mode is different then DTMF Remote Mode. This mode concerns the control of the 733 with an HT, and not the microphone.

- Press Band Select and select the UHF band.
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Press [CONT SEL] to move control back to the UHF band.
- Turn OFF the radio, press and hold [CONT SEL] while turning the radio back on, then release [CONT SEL]. The S-meter scale and the DT indicators for the UHF band will begin flashing. The LOCK indicator will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and press the following key sequence: "Axxx#" where "xxx" is the preset DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and the DT indicator will stop flashing. The radio can now be remotely controlled using the function chart below.
- To return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then press and hold [CONT SEL] while turning the radio back on.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SEL

7 8 9 C
CALL VFO MEMORY REPEATER ON

* 0 # D
DOWN POWER LEVEL UP REPEATER OFF

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down,
and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

Pressing "C" places the radio in cross band repeat mode. You will
recognize this because the of the dots between Kilohertz digits.
After pressing "C", put the radio back into standby mode with "A#".
The 733 will now cross band repeat. To disable cross band repeat, place
the radio back into the External DTMF Remote Control with "Axxx#".
If you can read through the lines, the 733 is capable of operating
as a frequency agile remote base. Now Kenwood just needs a CW IDer.

Assembly Mode Test

In the TM-733 Service Manual, it describes a test mode that I haven't
seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates
test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT],
[TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials
shows the digitized level.

This looks useful for checking all the keys and dials when you suspect
a bad connection.

Radio Versions & Freq. Ranges

Out of curiosity, I've been trying to figure out how other variants of
the Kenwood TM-733A can be easily "mutated" from the American "K"
version.

Here's what I've come up with so far. I'm curious to know if anyone
else has tinkered with this stuff. I figure since the radio is so
new, every one out there is still under warranty, so there probably
aren't many folks poking about with a soldering iron...

The K and P (Canadian) models seem physically identical so far. Only
the warranty card has a different part number. Is there anything else
I've missed?

The M2, M3, M4, and E2 models have the most liberal Tx frequency ranges: 136-174 & 410-470 MHz, instead of the US ("K") version's: 144-148 & 438-450.

The K version already has the widest 2m/70cm Rx range possible: 118-174 & 410-470, so there won't be any mods there.

The K and P models are lacking significant hunks of the 800 MHz Rx circuitry. In addition to some caps and inductors to link in the 800 MHz font end, IC202 is completely missing (the chip with "80R" output). I think it's a custom chip, so there's not much chance of finding one. ALL models other than K and P have this chip. If you're really desperate to get the 800 MHz Forbidden Band, you'll have to buy another radio, or try to order the chip from Kenwood Parts.

Also, K and P models have a "KCB20" for IC209 instead of KCB14. This is the "430 MHz Transmit Drive" chip. I think K is optimized for ~445 while the other is centered at ~435, but I'm guessing. The test/calibration instructions use different test frequencies for the two models, so there is probably some difference in the specs.

As for the CPU, it seems to detect which model it's in by reading pins 90 through 93 on power-up. (These are output lines to the DTMF encoder after power-up.) The pins are selectively pulled hi/low by wires and resistors to set the model.

If anyone knows how to override this setting by front-panel (software) controls, I'd be very interested to hear it!

As for hardware configuration, here's the info:

There are two wires (W1, W2) installed on the CPU board that apparently bypass resistors, tying the lines hi via 10k ohms (CP402 Rpack) instead of low via 100k resistors (CP403 Rpack). There are also three zero-ohm resistors that do something similar.
For those of you following along at home, that does indeed make five select lines, with only four going into the DTMF chip. :) I'm not sure about the fifth one, R413. It goes lots of places, including several dispersed pins on the CPU. It's only installed on the M4 (Chinese) model of the radio. Since the M4 model also uses a Chinese front-panel display, this line probably selects different glyphs and such. It's also tied into the descriptionless pin 77 of the CPU, called "RPT" (cross-band repeat?). Maybe they can't sell cross-banders in China.

The other four: W1/R410, W2/R411, R412, and R414 are the selectors that pull on the DTMF data lines. If we ignore the M4 and E models (which have more unique components), the K and M2/3 models have only these differences:

W1,2 R414
K,P Yes Yes
M2/3 No No

I'd bet one of those accounts for the different Tx range limits on the
CPU. Maybe the other allows for 800 MHz frequency tuning.

------------------------snip here and print--------------------------------

In keeping with the thread... I am using an LC with a kantronics KPC-2
hooked to the printer port... The station runs on Red Ryder 10.3 which is
available at many ftp sites. I got my initial packetsettings from AOL in
the Ham radio area... ?'s drop me a note, you will get a faster response
with e-mail as I omnly check the newsgroup once or twice a week :-)

2899. MSYS and WP pages

Hello all,

Please help!!!!!
Does anyone know how can I change, in MSYS117, the packet address where
the system automatically sends WP pages updates??? I have a real problem
here and the manual does not explain anything about this. I have the f.....
manual but no joy.

2900. JVFAX 7.00 Excellent !!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-27 08:28:39 UTC
From: paulb@iconz.co.nz
Message-ID: <33mtfn$kgq@status>
Source record: 47650

Hello all,

Just rec'd JVFAX 7.0 from DK8JV.

Fantastic job !!!

Not sure if available via ftp from EU or USA.

This has to be one of the best ever !!!

Have used JVF 6.0 ; JVF 7.0 beta ; now the final release.

Has all of 6.0 and also highcolor 64k mode 800x600, Scott-DX, Robot 72.

Cheers

Probably the biggest plus of the stand-alone TNC is that your station can be on the air when your computer is not up.

As for 9600 operations, you need to find out if there are plans in your area (unless >you< are a mover and shaker) to put up some 9600 baud resources. Getting going on 9600 is not as easy as 1200. You either have to have 1) a radio specificly designed for 9600 operation, or 2) a willingness to do radio surgery to bring out the connection points required for 9600 operation.

What this usually involves (at a minimum) is providing connections to the discriminator (or FM IF/detector chip) and into a place in the radio where direct FM modulation can be done. Many radios now use the phase-locked loop (PLL) as the modulation point. Unfortunatly, because of the nature of PLL's, they are designed to correct for frequency errors they find. In the case of 9600 baud operation, you are no longer putting tones on an FM audio channel. You are acutally putting 'raw' data on the modulator. This means that for desired operation, that the modulation point needs to have flat frequency response from about 10 Hz to 5 kHz. Most PLL's have a 3dB highpass effect at about 100-200 Hz. As yet there is no easy solution to the problem, so some rigs will just work better than others. If you still plan on getting a 9600 baud TNC, call the manufacturers of the products you are considering and ask them 1) about specific radios you may have now, and 2) radios they might suggest as good choices. Until about 6 months ago I worked for one of the TNC manufacturers (AEA) and know that they are very interested in developing information about what works and what does not.

From a use perspective, we have 4 user-access channels (acutally full-duplex packet repeaters) at 9600 baud here in the Seattle area. As far as I am aware, no one is using a Kantronics dual-speed TNC here. There is one Data Engine and DVR 4-10 - at Kantronics' shop, last I knew. There are 4 or 5 AEA PK-96's running locally, with TEKK Mini radios (440), with a Icom IC-260 (2M), and I think also with a GE MVP (2M). A bunch of the locals are using the TAPR 9600 modem kit in either PK-232's or MFJ-127x TNC's. There are 2 or 3 using the DRSI DPK-96 (4800/9600/19200) TNC. At this time I don't know

of anyone using one of the Paccom TNC's on 9600 either.

For radios I have sucessfully used:
Icom IC-290 (the first radio I modified)
Icom IC-22S (uses diode matrix synthsizer in 15 kHz steps. Designed for
146-148, tho usually goes to 145.35 or so OK.)
GE MVP (high band VHF - xtal controlled, easy to modify)

I currently use the GE on the local 2M packet repeater, as I hope one day to
get the IC-290 back on SSB. The IC-22S is probably going to get modified to
20 kHz channel spacing and to cover the whole 2M band. Then it will
probably go into my (ever evolving) portable packet station.

Hope that gives some insight on 9600 operations.

: /Peter SM0OHI

Because of the very slow TX/RX switching times I would not reccomend trying to use any of the O2/O3/O4 series Icoms for packet - 1200 or 9600. For that matter, handhelds in general are probably something most hams are not up to modifying for 9600.

I don't know what sort of availability you have to the radio manufacturer 'TEKK'. In the US they are selling radios designed specificly for data applications. The original application was in the 450+ MHz business band, but due to interest from the amateur community, they have started offering the radio in a 430-450 MHz version. The company will cut and install crystals the radio for the specific RX and TX frequencies you need and burn-in the radio with crystals prior to shipment. They even re-align the radio after the burn-in. Turnaround on orders here has been about 1 month. It is my understanding that the radios are actually manufactured outside the US, and the crystalling and tuning for US shipments is done in the US facility. So if you can locate a supplier of the radios close to home, you may be able to get these radios very reasonably. By the way, pricing in the US is about $140, delivered. At this price, if 2 watts is enough, its a much better solution than modifying a mobile radio, especially since the modified radio is usually a performance compromise.

You might try looking on 'ftp.ucsd.edu' in the /hamradio/packet directory area for info. Since all the 9600 baud amateur modems have the same general requirements of the radios, don't discount the information if is does not specificly mention the G3RUH modem. WD6EHR wrote a good guide to 9600 modifications some time ago, and I beleive he intended to update it as information about additional radios was developed, so you might want to mail an assistance request to him.

I hope some of this information is of use to you

: never bother you about video drivers, video modes, mouse drivers, "real"
: mode, AUTOEXEC.BAT, CONFIG.SYS, Extended Memory vs. Expanded Memory, memory
: managers, HIDOS, IRQ conflicts, CD-ROM drivers & cards, sound cards, and the
: magical 640k limit.

There is almost no >good< software for the Mac for amateur or shipboard applications. As a former Tech Rep (and Mac products specialist) for AEA, maker of the PK-232MBX, I know that the Mac software that AEA had to offer as of 5 months ago is very out of date, and there was virtually no prospect of it ever being updated. The software they did have was B/W only, and not System 7 aware. From comments I heard got from users, it was the best they could find, but definitly not first-line software.

As a shipboard user, you will be interested to know that there were (also as of 5 months ago) no offerings at all for grey-scale fax reception/display for the Mac, anywhere, for any price, that I had heard of. I had >lots< of requests for this kind of capability, and after looking at the prices of stand-alone FAX printers, a few of the Mac users decided to get a PC laptop just for receiving FAX. This is a great frustration to a lot of the marine dealers too, as the Mac laptops appear to be rather popular among the boating community.

I helped my folks get going with a Mac in '85, and just got them a newer system this year. It's not what I use at home, probably primarily because I'm one of those 'command line oriented' kinda guys. I spend more time now using Linux than Dos, and only occasionally fire up Windoze for a GUI. I've got the carcass of my folks old Mac, and one of these days I'll graft a new monitor to it - then I may not use Windoze at all! As a fan of the Mac in a general sense, its really too bad that with all it has going for it, that there are so few amateurs who are willing or able to develop software for it.

Lance G Marshall (lgm@cup.portal.com) wrote:
: all digital is on LSB on 20 meters

Actually packet and pactor don't care which sideband you are on, as long as they are tuned correctly. This is because packet encodes data on the tone transitions, and pactor switches mark and space data on each consecutive transmission block.

: Yaesu FT-207R
: Icom 02-AT
: Standard SR-C146A

: Will any of these radios work without modification?
: If not, can they be modified to work?
: Please e-mail JoeSullivn@AOL.com

The only radio of the bunch I would not reccomend is the IC-O2AT. This radio has very slow TX->RX and RX->TX switching times, and as a result, if you try to connect to a station that has a reasonably quick response time, your radio will miss the beginning of the reply. In this area (greater Seattle) the only complaints the NET/ROM node operators ever got from users saying they needed more TX delay from the node were from IC-O2AT and Kenwood TR-2500 owners. All the older and newer Icom HT's are OK, but the IC-Ox series are slow. I can't effectivly use my IC-O3AT for packet locally, but my IC-3AT works fine.

Also, contrary to popular belief, radios using relays for TR switching are not usually as slow as radios using PLL's. This is because most of the PLL'ed radios have only one PLL for both receiving and transmitting, and it has to jump (typically) more than 10 MHz and get locked up to switch either way. For example, the radio I use on 2 meters originally had a RX->TX switching time of 40 mS. The relay was measured and determined to switch in 3 mS. By changing some time constants in the power switching circuitry, I got the keyup time of the radio to 7 mS, which is as short as I decided to go, and the unkey time down to 4 mS (the relay was the limiting factor here). Most amateur PLL-equipped radios need at least 100 mS to get on frequency and into TX. So if you have an old crystal-controlled rig kicking around, and you know what frequency you need to be on for local packet operations, don't hesitate to order up a set of crystals and get some more milage out of the old rig. In some cases, its actually not too hard to convert a relay-switched radio to solid-state switching, too.

Hello all.

I'we heard lot about this TEKK MINI 70cm crystal rx/tx.
It appears that it is ready to go to 9k6, but what about
19k2, is it hard to get it up that speed. I assume you have
to do something about the IF filters, so is it hard or
expensive to get new filters for that station and is it
hard to replace them.

Any input welcome..

I have a pk232 that was upgraded to a pk232MBX. I would like
to use this for 2 meter tcp/ip. The question is do I need to
have a battery install in the pk232? The reason for the
question is that when I purchased the pk232 the manual stated that
do not put batteries in. With the upgrade kit it came with a
nicad battery. I have not install the nicad.

Wouldn't be a bad idea to replace the battery unless you intend on
running the tcp/ip on a full time basis as you have to operate tcp/ip in
the "Kiss" mode. I have been using my PK232mbx ever since I bought it
back in 1989 with the battery installed and never had a bit of problem.
Good luck and let me know via email how you make out
jim

Hi. I have a handheld, Kenwood TH-22E, that transmits from 144 to 146 MHz FM.
-Does anyone know the code that permits to broad up the band to 136-170 MHz FM?
Also, does any kow of any books that say anything more than the manual says?
Many thanks in advance.

2910. TNC-2 Source

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-28 11:58:21 UTC
From: rudi@chem.rug.nl
Message-ID: <33pu4t$nr4@rugch4.chem.rug.nl>
Source record: 47655
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

HI all,

I'm desperately looking for the Z-80 SOURCE CODE for the TNC-2, as I want to build a Z-80 TNC with the new higly-integrated Z-80 KIO-chip which combines all pheripherals into one chip. I have to modfy the source for the location (addresses) of the peripherals.

I scanned the internet, but with no succes. The (internet-available) tapr disks seem only to contain the HEX-images for the firmware not the source. I faxed the TAPR directly, but got no response.

Maybe some of you know the (internet) location of the source or do have the source. If so, please share it with me ! thanks !!

> have a battery install in the pk232?

The battery will power your PK's volatile memory so you can save many
of the parameters while the PK-232 is turned OFF. For instance,
without a battery, you must enter MYCALL every time you turn the
PK-232 ON, prior to using it to transmit in AX.25 (or other) modes.

If your computer / comm program loads the appropriate values into each
parameter during its initialization sequence, you don't need a
battery. Most versions of NOS require all appropriate parameters be
identified in the AUTOEXEC.NOS file. In other words, NOS will load
the PK's parameters every time you invoke NOS, so a battery is not
necessary.

-> rdonnell@eskimo.com Western Washington Amateur IP Address Coordinator
-> (206) 775-3651

Thanks VERY much for the reply, Bob. Seems my MastrII is one of the latter types you described. I picked it up at the Dayton Hamfest this year, and from the guys here in Atlanta who use MII's for voice repeaters, this one is of the newest production designs they've seen. My exciter has numerous adjustments to it; most of them are vertical metal cans with a plastic circular protrusion out the top.

My progress at this point...is that I have obtained my re-crystalled ICOM's (EC's) on my intended frequency of 441.0 MHZ. I have inserted 5C's on both the transmit and receive sides to provide compensation, if needed. I split the compensation curcuit on the control board to prevent Xmit audio from swamping the receiver. (I still get a curcuit with about 20K resistance between them though. Figure that should be enough separation) I have tried inserting 9600 audio already on the Compensation curcuit, but with only .6vdc signal level, no appreciable deviation was noted on the carrier. Getting the curcuitry to adapt amplify the .6vdc output of my MFJ built 1270+MFJ built G3RUH is my current holdup. I have yet to find anyone in the Atlanta HAM community that can lay out the curcuitry to match the G3RUH output with the 5vdc + deviation signal level required to properly deviate the MII's output. I would be happy to trade/pay/beg/whatever for anyone who could produce that curcuit design for me. Given a curcuit drawing, I can produce the whole thing, as I have the requisite assembly skills and tools. Just can't do the TTL design.

On the receive side, I must be close, as I can already receive the beacon transmitted by my personal station with the GE MII hooked into same 1270+G3RUH. It would help a great deal if you could give me the component ID's on the capacitors to remove in the IF section. BTW, my MII actually has a pin labelled IF which comes all the way out to the control board in front. Does yours do that? Aforementioned friends here didn't believe it until they saw it.

Finally, seems all of the Icoms for GE MII's have a filter RC curcuit in near the varactor. Did you have to remove that filter to get proper xmit ops? Also, would be happy to forward two 5C's to you in exchange for curcuit diagrams...then you could just plug them and and next winter....nnnnnooooooo problems when it gets cold. Remember, temp. compensation only kicks in OUTSIDE of 0-55 degree C temp range.

I look forward to your reply.

Regards,
Steve Diggs, President
East Atlanta LAN

----------cut here ----------

FT5200.9k6

Hola a todos...paso a detallarles la reforma para utilizar el transeptor yaesu
en 9k6.

De echo se trata de un dual bander, teniendo un buen desempe.o en 9k6, Ubicamos
la patita 13 del modulo de recepcion (inmediatamente despues del filtro
ceramico cf1001, este esta entre las patitas 10, 11, y 12 del modulo) y ahi
tomamos la se.al de recepcion para VHF, luego buscamos la patita 27 (en este
caso el filtro esta entre las patas 24, 25, y 26) y ya tenemos el audio para
UHF en recepcion.

Para transmosion tenemos un punto comun, que es la union de los preset que
ajustan el audio de ambos transmisores...estos son vr1001 y vr1003, muy
chiquitos y habra que tener cuidado al trabajar en ese lugar. Justo en ese
punto le aplicamos no mas de 1 volt pep y no mas...con eso tendremos la
desviacion justa.

Si queremos tener mejor recepcion y la posibilidad de usarlo con los satelites,
debemos cambiar el (o los) filtro ceramico de 455, en estos casos tiene puesto
el cfw455 "E" de 12 kcs y reemplazarlo por un cfw455 "D" de 15 kcs (en ambos
casos a -6 db), dandonos un poco de tolerancia para compensar el efecto doppler
del satelite (tengamos en cuenta que el equipo se corre de 5 a 5 kcs).

Esta reforma la hice hace mas de un a.o y recien ahora la probe a fondo y su
comportamiento es exelente...cualquier comentario o duda qrv.....Omar

-> E-mail to mcdonneb@iia.org

Here you go, Sir. Also, keep in mind that Down East Microwave is now
selling transverters for this application.

Regards,
Steve Diggs
---------- cut here ----------

Heatherington WA4DSY 56KB RF Modem

GRAPES (a Non-Profit Volunteer Organization of Georgia Amateur Radio
Operators) is selling full kits of the WA4DSY 56KB RF Modem for $250.
The proceeds from the kits support our packet network building activities.

You will need a transverter with a 28 MHz I.F. for the band of your
choice, a case, connectors, power supply and frequency determining
crystals. The printed circuit boards, documentation, State EPROM,
support diskette and all other parts are supplied.

The transverter chosen should switch as quickly as possible in the
5-15 msec range to be effective. We use the Microwave Modules MMt 432-28S
units; however, these are getting difficult to find except as used ones at
hamfests. The last few we purchased new were also pretty expensive ($389).
We believe that their 220 MHz units were quite a bit cheaper, but we've never
bought any new. On the hamfest market, we have been paying $125 to $185
for used, normally working units.

Maple Leaf Communications (Bob Morton, VE3BFM) is shipping a 220 transverter
which has good charactertistics and an even better price tag ($279). We
have two of these units and they seem to work fine. Contact Bob at
705-435-0689 or RR #1, Everett, ONTARIO, Canada, L0M 1J0.

The transverter must be linear as the modem has amplitude variations as part
of the converyed modulation, which must be reproduced by the transverter.
Usually any transverter capable of SSB operation is suitable if it switches
quickly enough.

We also sell a printed circuit board set that includes the State EPROM, documentation and support diskette for $110. Documentation sets are available separately for $20 and we have a VHS (beta by special request) Video tape featuring Dale Heatherington explaining the Beta modem design for $20.

Doumentation sets are creditable towards the full parts kits or board sets and the board sets are also creditable towards the full parts kits.

We pay U.S. shipping, however, we do require that the approximate difference between domestic ground delivery and premium shipping be sent in advance. Overseas second day air can cost up to $60 per kit! The kits weigh about 2.5 pounds each, and we can put 3 to 4 kits in a single box to save on shipping.

Please send orders (a letter is fine) and your check payable in U.S funds to:
GRAPES, Inc.
PO Box 636
Griffin, GA 30224-0636

We're sorry but we cannot accept Purchase Orders nor Credit Cards. Please allow four to six weeks for delivery.

THANKS!! Bob KA4BYP, email: ka4byp@netcom.com

2918. Balloon Flight is on Again...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-28 22:22:17 UTC
From: danander@cc.usu.edu
Message-ID: <1994Aug28.162217.25859@cc.usu.edu>
Source record: 47663

Due to a problem with the GPS receiver and on-board BASIC computer, the balloon flight was delayed for approximately 2 weeks. The new flight is scheduled for Tuesday August 30th 1994 at 2pm MDT.

This balloon flight is rather unique in that it is a prototype concept when one of the first data acquisition system is sent to the Martian Surface. The general concept is that the balloon will become heated and rise during the daytime, and at night it will descend. Dragging behind the balloon will be a type of funnel to "suck" up materials off of the Martian surface. The materials will be analyzed by an on-board computer and then the data telemetered to an orbiting satellite which in turn amplifies the signal to be sent back to earth.

The amateur balloon flight for this launch has on board:

BASIC Computer for making temperature and pressure measurements
TNC
IC2SAT 2 meter transceiver
TRW GPS Receiver for position fixes
ARGOS Satellite Transmitter (TELONICS Model ST5)

The payload was put together by Engineering Students at Utah State University.

Adrie:
I use a Mac SE for packet. I have the SE connected to my PK-88 with a modem cable purchased at the local computer store. the PK-88 has several cables, because I use it with different radios. You just need the cable for your radio. If you don't want to make up a cable, MFJ sells cables for connecting various TNCs to various radios. The price of each is in the $15 range.

For software, no special packet program is needed. On the Mac, I use shareware obtained from my local Mac user's group. It is called ZTerm, and among other neat features, has a full scrolling buffer. You can also write to your disk as you load the buffer with incoming and outgoing text.

I haven't tried an LC, but I think the fellow across the hall at work has one on his desk. Ij'll try my hookup on his machine and see how it goes.

Hello all!

A friend of mine (IK2YFR - Stefano) is searching for a public domain
(or shareware) software that can drive his Kenwood 450, to obtain
frequency scanning and other simple features.

He built a digital interface from PC to 450 but he was not able to
test it due to the lack of a proper program or adequate documentation.

I heard about CT, ScanCat and Log: these soft whould do th work, but they
are not in the public domain and in addition they are not so easy to use.
Stefano needs a simple software, in source form, to be able to modify it...

May anyone help me?

Thank you and greetings from Italy! Alex

Message-ID: <199408291247.AA00884@ub4b.eunet.be>
Source record: 47671

Friends,

I'm trying to access US dxclusters while connected to internet.
I know there are a number of AX25<>Internet gateways in the states (found quite a number of them). I discovered also that once connected to these nodes I have access to hundreds of TCP/IP nodes. But... I can not see the trees through the forest anymore.
There must be a number of gateways or TCP/IP nodes who give access to local DXclusters, if not via IP, then via a VHF or UHF port (if not linked through real IP ports)...

So far I found cluster access in W5, KH6 and KL7 - land. I'm particular looking for DXclusters on the east coast, westcoast and midwest. But... any tips are welcome.

Pse reply to my Internet address: p_casier@ub4b.eunet.be

Tnx! - Peter ON6TT.

<Unix also has some "big system" features in it that make it easier to
<protect yourself from wayward software. I think we've got several
<unix machines around here that have close to 700 hours continuous
<uptime (last stop was due to an extended power failure that extended
<past the UPS hold up time..) The usual Microsoft DOS system has to
<be restarted several times a day...

<bill wb9ivr

Well, I guess I can weigh in and start another flame war (just checked
my nomex suit. It should withstand a few flame blasts).

I use Unix, DOS (5.0), and Daytona (NT 3.5 beta) here. Each has its
strengths and drawbacks. I agree with Bill that Unix has the strength
of not allowing a user job to crash the system. HOWEVER, this only
applies to BIG machines like a VAX or HP 9000. Most people who only
have access to small machines like a PC or Mac don't have this luxury.
Many of the Unix implementations don't have or use the MMU (memory
management unit) which gives Unix this capability. I disagree that
DOS machines typically need to be rebooted several times a day. What
needs to be rebooted are DOS/Windows 3.1/Lan Manager machines and it
is more like 10 times a day!

This is my current crusade. If you want an OS that DOES NOT let user
jobs crash the OS it MUST HAVE an MMU. I was quite surprised to learn
that Apple's System 7 apparently does not make use of an MMU. The
result is that it is still possible to crash the OS even on a Mac.
Apparently this happens less often with the Mac because the software
is written better (I am not sure I believe this but it is possible).

Bill's suggestion of OS/2 (should be version 2.0 or higher) addresses my main complaint with OS's. It runs full MMU (read that protected virtual mode). The reason that it crashes less often is that the MMU as implemented in OS/2 (and NT) does not allow bugs to extend beyond the program that has failed!

We have an on-going flame war here where I work of Motorola vs Intel. My main complaint with the Motorola world (principly Mac's, but also embedded OS's such as pSOS, OS9, and VRTX) is that they do not implement memory protection by INSISTING on the presence of a hardware MMU. For those of you who program in C and C++, you have probably written at least one program with the following type of bug:

```
int useful_function(int *number);
int a_number;

function()
{
useful_function(a_number);
}
```

The bug, of course, is that the line shoule read:
useful_function(&a_number). This code is guaranteed to write over

1) your code
2) your data
3) another process's code
4) another process's data
5) the OS
6) the interrupt vector table

Take your pick of any or all of the above. The bottom line is that such a bug is guaranteed to cause havoc in the machine it runs on if there is no MMU.

Let me translate here "NO MMU == 386 flat model" or "NO MMU == Motorola before 68030".

The flames from this post ought to be interesting!

I need to interface RS232 from a TNC to my FT-990.
There is no info on the FT-990 FSK input signal
levels - but those who know say it is TTL.

Is there a good universal way to interface RS232
to TTL ? how about an opto-isolator ?

MFJ's MacMultiCom 1.0 for the 1278 DOES support 16 level grayscale FAX
reception and transmission. It also supports color SSTV in a number
of different popular formats. The program takes advantage of System 7
features, but will still work on a MacPlus (of course you only get B&W
pictures then). MacMultiCom supports all of the other 1278 modes, too.

Unfortunately, MFJ doesn't advertise it very much. However, they've been
shipping it for over a year.

AH6IX and I wrote the program for MFJ.

Source record: 47682
Cross-posted to: rec.radio.swap,rec.radio.amateur.digital.misc,comp.robotics,comp.sys.ibm.pc.hardware.misc,comp.sys.misc

At a swap meet I recently bought (very cheaply) a device that is said to be an EPROM programmer, and which consists of a 2 x 5-inch board containing a 28-pin socket, a 68HC705, a ROM, and a few other chips one of which is labeled "Altera module."

Coming out one end is a flat cable with a 24-pin DIP plug, obviously for EPROM emulation or something like that.

But the fellow who sold it to me said that it could be connected to the serial port of a PC using a few of the wires in the 24-conductor cable, and the software for programming EPROMs was then in the firmware on the board, with the PC serving only as a terminal.

Obviously, the power supply is missing and I can't do anything without knowing the pinout. Does anyone recognize this product?

Marvin J. Munster (mmunster@qualcomm.com) wrote:
: Does anyone know the FTP address for TAPR? The one I have doesn't seem to
: be working.

Here is the most recent information. TAPR.ORG will be changing
locations the end of the week, so some outages might result.

In addition, I just found out that the ftp site we use had an 'act of god'
failure last week and Bill Beech is working on reestablishing the
system. I do not have a current report, but it should be available now
or very soon.

Cheers - Greg

'file-request@tapr.org' can also be used to access TAPR's file system.
The electronic issue of the PSR (Packet Status Regiester) is now being made
available via the server as a file. If your club editor is looking
for packet articles and information to republish this is a great source.
To get more information, send Internet mail to 'file-request@tapr.org'
and include in the message of the body the command 'help'.

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.hereford.ampr.org' in the directory
pub/hamradio/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

-> Tom WB7ASR...

Tom,

I have been trying to get the TM401 to work reliably at 9600 baud with 6 months, and I can tell you from direct experience that it is NOT a good candidate for modification. The problem is isolated to the transmit interface: the TM401 uses a PLL curcuit that is close coupled to the VCO. In the normal approach to 9600 interface, you insert the 9600 audio directly at the Varactor in the VCO and everything works fine. In this case, the PLL senses a frequency drift after all but the shortest of packets, and commences to cancel the drift. The net effect is to cause short packets to transmit OK but long packets are almost always corrupt. FYI, the receive side is great, as the TM401 uses the CF455E discriminator, which gives excellent receive bandwidth in the IF.

I haven't given up completely. James Miller, G3RUH, has agreed to look at the schematics of this rig with ideas on ANY POSSIBLE way to make the rig work. Possibilities are to lengthen the RC time constant in the PLL's feedback curcuit, or perhaps modulate the master reference oscillator of the PLL, along with the Varactor. (To prevent the PLL from detecting a frequency drift) James just sent me a confirming note on 8/28 acknowledging receipt of the info package, and his intent to shart on the project in the near future.

Finally, if you just insist on aggravating yourself, <grin> I will send the interface points in a follow up email. Also, I'll be happy to let you know what James Miller says on best ideas on the TM401 interface. BTW, the TM201 will work the same way, I'm sure.

Hi folks!

I'd be interested to know if there is any (future?) possibility to use
my Kantronics KAM in DAMA mode, i.e. not just via setting FRACK etc.
Does anybody know if there is/will be a firmware update to accomplish
this?

vy73,

Chris, DF8BN

2946. Balloon Flight Delay 'til OCT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-30 22:52:42 UTC
From: danander@cc.usu.edu
Message-ID: <1994Aug30.165242.25995@cc.usu.edu>
Source record: 47691

Well...

For those who have been following the "progress" of the MARS BALLOON PACKAGE (MBP) balloon flights it turns out that Murphy has struck our ballooning efforts once again.

The balloon launch from the Logan, Utah airport was a l m o s t a success. The winds calmed down after a slight delay, all hardware systems checked out and the super-pressure balloon filled up with helium without a hitch. But during the launch one of the runners (a person who runs with the payload to ensure that the payload doesn't drag along the ground or hits an object in the payloads initial 5 second ascent) may have inadvertently "jarred" the payload package that had caused a power fluctuation to occur.

This power fluctuation (momentarily off then on power state) may have caused the release guillotines to fire which cuts a support line from the balloon. The balloon ascended to approximately 150,000 feet when it burst, but without measurements or telemetry to the ground and satellite since that nasty constant called gravity caused the payload to move in the opposite direction.

The next scheduled balloon flight will not be until October I am told, but we promise to keep those of you interested continually informed on this interesting experiment.

-> other information.
-> Thanks & 73s,
-> Tom WB7ASR

Tom,
Wellll, I guess you're a glutton for punishment. <g> RXA is available at the junction of D4 and R29 in the IF section. I used Radio Shack 10/26 AWG shielded audio cable, and made the connection on the solder side of the board. I found a ground close by on the board and soldered the shield to that. As I recall, I didn't use a resistor between the modem and the radio, because the signal level was about right for the TAPR 9600 modem. You may need some level compensation; a 2 to 10K resistor will do the job. If the level is too high, the modem is swamped and loses sensitivity.

On the TXA side, I interface 9600 transmit audio at R90. which is on the audio side of the varactor, isolated by a polarized capacitor. (which is good) I used a 2k resistor in series between the modem and the insertion point.

Again, this is the interface info for a Kenwood TM401. IT IS NOT TOTALLY SUCCESSFULL. Long packets will be distorted by this transmit interface.

I've been quite impressed my James Miller's helpful attitude, and expect to hear from him soon. Will let you know what I get from him ASAP. I would appreciate the same in return, if anything turns up.

In article <kb5rtk.42.2E62983A@rt66.com>, kb5rtk@rt66.com (Cliff Nail US - 227) says:
>The new Kenwood TM-451A is really sweet for 440 9600 baud!
>
>Cliff

But does the TM-451A tune down the the satellite band of 435 MHz? It would be really nice to
know which (if any) of the new 9600bps ready radios, single or dual band, will tune down that
low. It almost seems as if it was intentional that the radios _do not_ tune down that low so
as to preclude these radios for satellite use.

I know that my TR-851 has built in limitations in its design to go up to the 440-450 portion
of the band. Perhaps the new radios cannot be designed to go any lower.

Cliff, could you comment on how a 9600bps modem interfaces to your radio?

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

Hello everyone,

Does anyone know how the TM-451A Kenwood handels at 9600 baud? I am
using it packet here in Albuquerque but I am at 2400 baud because no one is on
at 9600 baud yet! I was wondering if it is in wide use yet and what promblems
I might (if any) face when I decide to make the jump!

Thanks!

From: Carl Makin <makinc@hhcs.gov.au>
Message-ID: <1994Aug31.134424.962@hhcs.gov.au>
Source record: 47695

I have a LC III that I use for packet.

It's connected to the house Ethernet and runs;

MacTCP 2.04,
Fetch,
Anarchie,
NCSA Telnet,
MudDweller (Great for converse),
Gopher,
Mosaic,
Eudora and
Nuntius.

I've trialed Gopher and Mosaic over a 4800 baud radio link to the local gateway and it worked but was very slow. I run JNOS 1.10f as the radio<->Ethernet gateway and provide POP3 and NNTP services for myself and local amateurs. I also talk CAP to my FreeBSD Unix box.

Fetch handles Amateur radio timings quite well as does NCSA Telnet (v2.6).

Feel free to EMail me if you have any questions on the above.

Carl.

I would definitely try first to lengthen the RC time constant in the PLL
feedback circuit, since that might be the easiest to do.

"HOWEVER, this only applies to BIG machines like a VAX or HP 9000." Wrong.
A lowly PC running LInux provides this same protection.

> This is my current crusade. If you want an OS that DOES NOT let user
> jobs crash the OS it MUST HAVE an MMU. I was quite surprised to learn

> is written better (I am not sure I believe this but it is possible).

"Apple's System 7 apparently does not make use of an MMU." Wrong again. You
don't fully understand the function of an MMU, else this statement and the
next I'll quote wouldn't have been said.

> We have an on-going flame war here where I work of Motorola vs Intel.
> My main complaint with the Motorola world (principly Mac's, but also
> embedded OS's such as pSOS, OS9, and VRTX) is that they do not
> implement memory protection by INSISTING on the presence of a hardware
> MMU.

I'd bet all of the mentioned embeded OS's offer versions using the MMU the
way you seem to want. Mac System 7.x does use the MMU for virutal memory but
does not use it to protect applications from each other. This is the price
Apple paid to remain compatible with older Macs. And I have no doubt Mac
applications are better written and better behaved than Windows, as Mac
developers may scream about hardware changes from generation to generation
but as long as they stay within Apple's "Inside Macintosh" specification
they rarely get burned.

2957. wanted: tnc firmware with netrom

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-31 18:44:48 UTC
From: janv@iaehv.iaehv.nl
Message-ID: <342j30$fli@iaehv.iaehv.nl>
Source record: 47700

Hello packeteers,

I am looking for firmware for my tnc2. It should have netrom capabilities. I currently have tapr 1.1.8 and wa8ded 2.6 and nord><link 2.3c.

My local bbs has no others.

Is there any ftp site or other medium that has rom images online???
Newer versions of tapr wa8ded and nord><link are also welcome.
by the way nord><link2.3c supports dama.

greetings jan verhoeven janv@iaehv.nl

2958. TAPR2 TNC Mods; Bit Regeneration?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-08-31 20:28:36 UTC
From: mikewood@mercury.interpath.net
Message-ID: <342p5k$kqj@mercury.interpath.net>
Source record: 47701

'I'm in the process of building and installing a 1200 baud bit regenerating full duplex packet repeater for the PacketCluster group in this area. (Yes I know you can repeat 1200 baud fairly reliably through a standard voice repeater, and we are already up and running in that mode with DCD control of the repeaters's PTT. For a number of reasons we will be changing over to bit regeneration.)

It's been a real struggle finding info on how to modify a TAPR -2 clone TNC (MFJ-1270) for bit regeneration repeater operation. So far I've not found an already engineered solution.

Heres what I have found:

1) Discussions via Internet with several who had done bit regeneration modifications to non-TAPR 2 TNCs did not apply to TAPR-2 clone TNCs because the Txdata and Rxdata switching is different.

2) I was told that the TAPR journals had several articles on 1200 baud bit regeneration mods for TAPR-2 clones. I purchased all of the TAPR back issues. Almost nothing regarding the subject was contained within them. Lot's of mention by people using packet rengerating repeaters (mostly 9600 baud) or advocating the use of them, but nothing in the way of how to mod a TAPR-2 TNC for 1200 baud bit regeration.

3) Someone told me PacComm sold an EPROM for TAPR-2 TNCs that turned the TNC into a 1200 baud bit regenerator including a FIFO elastic buffer. After four phone calls to TAPR no one there has yet to FAX me specs on this EPROM. Although they say they have it ($30.00 each), I have been unable to get anyone there to give me me ANY technical description of it. I don't know if it reallly exists or whether it works only with their hardware, etc.

So can you point me toward a solution or share details on how you have modified a TAPR-2 for this purpose ?

You gotta be really careful when you start dinking with the PLL loop filter. There are usually multiple time constants of interest. It is a really good idea to first measure the VCO gain over several band segments (since the gain of most VCOs isn't exactly linear with respect to frequency), determine the phase comparator gain and the loop filter characteristics. Then, calculate the loop frequency and phase response.

Make sure that your modifications to the PLL loop filter do not make the PLL unstable or increase the reference frequency sideband amplitude. Also, some loop filters have an interaction between the corner frequency and damping factor; by the time you get a low enough corner frequency, the loop will tend to ring at a very low frequency. Also, the lower the loop filter corner frequency, the longer it takes the loop to lock up, though some filters have diodes inserted in a cheap adaptive filter scheme.

By the way, MX*COM publishes a very nice databook, which includes charts of BER vs low frequency response of transmitter and receiver. They recommend very highly using "two point modulation", in other words, modulate the VCO and the PLL reference. By modulating the reference, the loop regains good low frequency (even DC) response.

A previous poster suggested that the longer the packet, the more the PLL could adjust out the packet. This is not accurate; the reality is the PLL always is damping out low frequency modulation of the VCO. This has a negative effect on the bit error rate (BER), such that longer frames are pretty much certain to have an error while the shorter frames squeak past.

2960. Software to drive a radio data modem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-01 08:54:08 UTC
From: overdijk@ecn.nl
Message-ID: <3444rg$8hp@ecnits.ecn.nl>
Source record: 47704

Hello friends,

I've got a Satelline-1AS Radio Data Modem here on my desk.
This is not a Hayes compatible thing. It does half-duplex
communications. By switching DTR on on the RS232-port, the
Radio Modem is powered on. (signalled via DSR). When CD is
switched on, there is something to receive. To send something
switch on RTS and wait for CTS. This can take a while because
it's possible that the radio channel isn't free yet.

This Radio Modem is from a Finnish company and is also known
by the name MOBIDEM. Does anyone has a piece of software to test
this thing out, before the application for this thing is written?

Is there a FAQ for this group? My appologies if my question is
inappropiate for this group.

Greetings,
Harrie.

2961. Packet monitor

PACKET MONITORING WITHOUT A TNC OR MODEM
USING FREEWARE AND A UA741 OP-AMP (COMPUTER POWERED)

For those of us not yet ready to invest in a TNC, Baycom, or PMP modem, there is a way to monitor packet using only the VHF receiver and a computer with a UA741 op-amp at the mouse port. It's called PKTMON12. The program is available from ftp.funet.fi, listed as PKTMON12.LZH. I'll convert it to a ZIP and upload it to DRIG BBS this weekend.

This program works great and is FREE. The op-amp interface circuit is shown in the documentation of JVFAX6.0, HFFax, and HamCom30. Just connect the 741 input to the receiver speaker leads and start copying packet (1200 Baud.) The system also will decode HF packet although I haven't tried it yet.

==========
The opinions expressed above are my own and do not reflect those of my employer or my wife.

2962. Small 1200 Baud packet modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-01 18:36:53 UTC
From: JAY@medicine.dmed.iupui.edu
Message-ID: <JAY.54.2E661F45@medicine.dmed.iupui.edu>
Source record: 47716

I would like to build a small device that will send packets when a button is pushed or some other event like that.

To do this, I would need a small 1200 baud modem. Since this device will only send unconnected packets, I don't need the entire AX.25 protocol in this device. I can hardcode the packet in an EPROM then send it when the button is pushed.

Does anyone know where I can find a schematic or information on a 1200 baud modem for this purpose?

Thanks
Jay

MattAJ (mattaj@aol.com) wrote:
: I'm looking for a cable to match my Radio Shack 2meter rig
: to my Kam Plus....

: I'll gladly pay for one.

: Matt/N8QNW

Matt: You need 1 resistor (2.2K ohms), 1 capacitor, and one
plug for the mike input jack on your HTX 202. Follow the instructions
in your KAM manual for connecting to Yeasu HT's. Use the vhf cable
that came with the KAM. The plug for the HT speaker is already
made up in this cable? If not also buy a plug for the HTX 202
spkr jack. You also need a soldering iron and 60/40 rosin solder.
Everything is available at Radio Shack. Even if you have to
buy the soldering iron, it will be cheaper than buying a cable.

>440-450 portion
>of the band. Perhaps the new radios cannot be designed to go any lower.

>Cliff, could you comment on how a 9600bps modem interfaces to your radio?
To be totaly honest I don't have it in 9600 baud mode yet! No one around here
is on 440Mhz at 9600 baud so I on at 1200 right now. All I have to do though
is tell my TNC to go to 9600 and tell the radio (by setting a switch and
wiring a nother pin high {when it transmits}) and I am gone!
The interface is a 6 pin mini din (i.e. kenwood got smart on this one and
made it a ps/2 mouse 6 pin min din, these are really easy to find. Radio
Shack). As far as comment on the interfaces well on the TM-751a it is PLUG
and PLAY!!!

I hope this helps if not please repond! :-)

Rudi van Drunen (rudi@chem.rug.nl) wrote:
: I'm desperately looking for the Z-80 SOURCE CODE for the TNC-2, as I want
: to build a Z-80 TNC with the new higly-integrated Z-80 KIO-chip which
: combines all pheripherals into one chip. I have to modfy the source for the
: location (addresses) of the peripherals.

TAPR does not own the rights to the source, therefore we don't have it
posted anywhere. I checked with the offcie and they did not receive
anything from you. Please note that the TAPR Fax number changed in
January. (817) 566-2544 is the new fax number.

As another note - due to large number of requests we get daily, the
office puts questions and requests from members on top.
The TAPR office is only manned by one non-technical volunteer who handles
all the various details of the TAPR organization.

:I scanned the internet, but with no succes. The tapr disk
:seem only to contain the HEX-images for the firmware not the source. I faxed
:the TAPR directly, but got no response.

There are several possible sources for AX.25. The TexNet disk in the
TAPR library has a Z80 AX.25 implementation. PMP (Poor Mans Packet) has it
in C. Eventually the new version of AX.25 2.2 will be released in C.
Then there is an implementation in C in the various NOS packages.
So - it is not hard to find examples.

Between all of those you should be able to find something useful.
The ARRL will have available end of the year the 2.2 docs and SDL for
review before adoption next year.

If you need the csurce for a commerical project, I will be glad to get
you the necessary information in order to contact the authors of the
TAPR TNC Source. Send me e-mail directly.

: Maybe some of you know the (internet) location of the source or do have the
: source. If so, please share it with me ! thanks !!

Hello all! The following file is a list of some Packet<>Internet gateways.
Thanks to all the OMs that replied to my previous requests/bulletins, and
special thanks to IW3BKE, IW1CXZ and HB9MPL: they collected and sent to me
the greatest part of this list.

Notes: the "Other" column reports an additional address where you can
send mail to request informations about the gateway. The first part of
the list refers to "fully qualified" gateways (i.e.: I found Internet
and packet address...), the second part is related to gateways I was
not able to find the Internet Address at the time.

Greetings from Italy!

Cross-posted to: rec.radio.swap,rec.radio.amateur.digital.misc

I have a nearly new AEA PK-96 1200/9600bps TNC for sale. It's a packet only box and will do 1200 and 9600 but only one at a time. It's nearly new...I haven't sent in the card yet. See the review in the Sept. QST for more details. There just isn't enough 9600 activity in my area to justify keeping it. Includes power and TNC-to-radio cables, manual, and original box and packing. Asking $175 including UPS shipping to continental U.S. If interested please contact me via email.

Thanks and 73... Mark AA7TA email: markm@ramp.com

Hmmm, I did that, I used a phone line Modem for Packet Radio operation, though
it was rather "off the drawer" than off the shelf ;-)

I built several years ago a phone modem kit based on the AM7910 chip, last year
as I heard about the Baycom software, I tought I could use my previous kit with
some adaptations...
The thing is that this kit was suited for 300 bds (V21) and 75/1200 bds (V23),
the French Minitel standard BTW. I had to surgeon somewhat the board to make
the modem chip operate in 1200 bds mode both receiving and transmitting. This
has been done by connecting the RTS input to the TX/RX signal.
It worked fine for several months, later I had the info that the chip could be
set to the "loopback" mode (thanks Pawel), making it receiving and transmitting
on the same set frequency set for analog test purpose.
Note that the V23 1200 mode is using 1300 Hz and 2100 Hz, this 800 Hz shift
is now recommended by TAPR when tuning a TNC2 kit for better spectrum optimization.

I guess CCITT makes some studies on the choice of the frequency set for a given
standard, it's probably good to use it.

Recently I bought a PCB for the A&A Baycom modem kit, I refurbished my AM7910,
the whole thing is much smaller, and is QRV 300 bds on HF :-)

Well, all this is limited to 1200 bds at best, I know :-(

2973. 9600 baud using Kenwood TM241A???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-02 20:18:38 UTC
From: root@comu2.auckland.ac.nz
Message-ID: <3481au$q5e@ccu2.auckland.ac.nz>
Source record: 47717

While the questions are being bounced around, does anyone know
the details of the mods to make to a TM241A (2 metre) to make it
work with 9.6k? I'd like to stick one on my phone BBS and run
JNOS or something similar, but 1.2k is just too slow to contemplate...!

Thanks in advance,

Richard

2974. Periodic Announcement - ARRL Email Information Server (info@arrl.org)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-03 03:00:06 UTC
From: mtracy@arrl.org
Message-ID: <rec.radio.info-arrl.email.info_778561204@ve6mgs.ampr.ab.ca>
Source record: 47719
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

I'm looking for detailed information reguarding HF digital signals.
I'm in the process of designing a modem and am frustrated at the
conflicting signal specifications uncovered during my search. At this
point, I am looking for signal parameters as opposed to protocols (but
thay will be of interest soon).
The ARRL Handbook contains some of the details, but they are scattered
and incomplete. Can anyone suggest a reference?

2977. Re: 9600 baud using Kenwood TM201 & TM401

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-03 16:11:00 UTC
From: steve.diggs@totrbbs.radio.org
Message-ID: <1978.18.uupcb@totrbbs.radio.org>
Source record: 47722

-> You gotta be really careful when you start dinking with the PLL loop
-> filter. There are usually multiple time constants of interest. It is
-> a really good idea to first measure the VCO gain over several band
-> segments (since the gain of most VCOs isn't exactly linear with
-> respect to frequency), determine the phase comparator gain and the
-> loop filter characteristics. Then, calculate the loop frequency and
-> phase response.

Thanks much for the feedback, Dana. I'm hoping that G3RUH will come thru
with a design for how to two-point modulate the TM401. To get this class
of radio working on 9600 would really open up 9600 to a LOT of hams.

-> By the way, MX*COM publishes a very nice databook, which includes
-> charts of BER vs low frequency response of transmitter and receiver.
-> They recommend very highly using "two point modulation", in other
-> words, modulate the VCO and the PLL reference. By modulating the
-> reference, the loop regains good low frequency (even DC) response.

I'm not familiar with MX*COM. Could you provide address/phone info. on
them?

>The ARRL Handbook contains some of the details, but they are scattered
>and incomplete. Can anyone suggest a reference?
>

What, specifically, are you asking? Ham HF digital modes use only a couple differest FSK shifts: 2125/2295 (170Hz RTTY and AMTOR) and 2100/2300 (200Hz packet and Pactor). Most RTTY DX uses 45 baud although there are many 75 baud users out there. AMTOR is 100 baud. Pactor is 100 or 200 baud. Packet is 300 baud.

73, Drew

Is it possible to create a software application that would eliminate the need for a radio modem: In other words, just taking the sound from a radio and putting it into the sound input on a Mac.

Why couldn't such an idea work?

Source record: 47728

Jay Sissom (JAY@medicine.dmed.iupui.edu) wrote:
: I would like to build a small device that will send packets when a button is
: pushed or some other event like that.

: To do this, I would need a small 1200 baud modem. Since this device will only
: send unconnected packets, I don't need the entire AX.25 protocol in this
: device. I can hardcode the packet in an EPROM then send it when the button is
: pushed.

: Does anyone know where I can find a schematic or information on a 1200 baud
: modem for this purpose?

I don't have specifics here, but any of the modems specified for Baycom or
Poor Mans Packet would do the job. The only thing simpler would be to use
the transmit half of the 2206/2211 modem chip set used on the older-design
TNC's. The 2206 is a digitally keyed AFSK generator. The 'down-side' of
such a modulator is you have to choose stable components in the oscillator,
and you have to have a counter or a calibrated signal generator to set the
tones - and they could drift at extremes of temperature. That won't happen
if you use on the of the crystal-controlled modem chips.

: Thanks
: Jay

Jeff, you can order the #190-PCB baycom modem for $12.95, this circuit uses
the AM 7910 chip, if this is the one you have.
Their FAX number is 714-952-3280, they are located in Anaheim(CA) is memory
serves me.
The board is roughly of the business card size and works both 300 HF and
1200 VHF (see advert. in CQ magazine).

Enjoy,

73 de F5HNK/Patrick

2990. Re: BPQ with KPC-9612?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-05 15:51:31 UTC
From: Karl Medcalf <kmedcalf@delphi.com>
Message-ID: <Zc0yG5b.kmedcalf@delphi.com>
Source record: 47731

Hello Bob. I have run the KPC-9612 with BPQ - dual port. One important difference from the KPC-3 is the fact that the KPC-9612 is dual port. Check the MYDROP command - default is 0/1 which means the 1200 port has a KISS address of 0 and the 9600 port is KISS address 1.

In BPQCFG.TXT, you'll need to set the CHANNEL= statement to A for 1200, and to B for 9600 (e.g. CHANNEL=A). The IOADDR and INTLEVEL should be set for the correct COM port you're using. Remember, you'll need TWO PORT configs in the BPQCFG, both with the same IOADDR and INTLEVEL. Also, the SPEED= needs to be set to the same as the MODE command in the KPC-9612.

Hope that helps.

>a TCP error. It also stops retrying very soon.
>Has anyone got experience with this?

No direct experience, but from a programming standpoint I would guess that the WS_FTP is expecting a very fast reply (which over phone lines is fine) but it's timeout threshold is much too fast for radio-based work. You might want to check the program for a parameter to update or contact the author.

I just checked my WS_FTP -- Play with the timeout value in the ADVANCED menu of the session settings. Perhaps that will do the trick. Let me know!

Source record: 47541

The pc modems that are "SoftModem Technology"
are now reasonably priced IMHO, and should be reprogrammable
for the modulation standards of the radio and TDD worlds.
This would allow "off the shelf" hardware, but we need custom
software. These modems download the DSP program from the pc.
The Digicom DSI Connection and the similar Cardinal MVP144DSP.
use ram program storage, not flash-eprom.

2997. Whats the theory on the DCD state machine?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-06 16:22:25 UTC
From: BMOERS@corp.qgraph.COM
Message-ID: <01HGSFT76TAA000A2T@hub.qgraph.com>
Source record: 47542

Can some one explain the theory behind the DCD state machine circuit!
What is significant in the HDLC data stream that this thing keys in on?
How does the circuit typically interface to a TNC. I've never
seen the schematic or state diagrams, so perhaps what I am asking
is obvious given those. Looking at the schematic of the PK88, it looks
as if it would replace the modem chip's (AM7910) carrier detect output.
Or would the circuit just gate the RX Data to the SDLC hardware?
Questions, questions, questions!
I don't presently have one, but I would like to understand the theory,
and then add one to my PK88! Thanks!

3001. Question: Variable Baud Rate Modems/Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-06 18:18:12 UTC
From: malari@ix.netcom.com
Message-ID: <34ibp4$4bd@ixnews1.ix.netcom.com>
Source record: 47546

I don't know how to ask this question in general terms but I l'll do my best....

I am looking for information or a source to get specific information about changing a modem or Packet Terminals baud rate to an odd baud rate (such as 2500 baud, 1600 baud, 1250 baud etc.).

The real question is:

Does this require hardware modification, software modification or both?

I am mostly interested in packet modifications but anything relating to modems will work. I can apply the theory (I hope) for modems to packet.

ANY HELP OR INFORMATION ABOUT THIS WOULD BE GREATLY APPRECIATED.

Thanks, Mike

3002. New UK TCP/IP mailing list

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-06 20:53:30 UTC
From: eeyimkn@unicorn.nott.ac.uk
Message-ID: <34iksa$52h@unicorn.ccc.nottingham.ac.uk>
Source record: 47547
Cross-posted to: uk.radio.amateur,rec.radio.amateur.digital.misc

Hi folks,
There is now a mailing list set up for the UK TCP/IP Networking Group
(UKIP). This is a loosely-organised group set up to promote the use of
TCP/IP networking protocols over radio in the UK, and to encourage the
establishment of high-speed backbone links and network gateways.

If you want to subscribe:
Send mail to ukip-request@cs.nott.ac.uk. This is handled by a
human rather than a listserver, so be polite :-)

To post to the list:
Send mail to ukip@cs.nott.ac.uk. Subscription requests and other
administrative bits and bobs should go to ukip-request, _not_ to
the list as this just means that lots of people read your
subscription message and get cross.

Have fun! I hope to see lots of interesting discussions happening very
soon.. *grin*

By the way, the next UKIP meeting is to be held on the 15th October in
Nottingham. Details to follow..

73 Mike

From: rgm@bilbo.baylor.edu
Message-ID: <34j7poINNob4@BUDS1.baylor.edu>
Source record: 47549

Has anyone out there used the Ramsey FX line of VHF and UHF radio kits for 9600 baud paket? Ramsey advertises that these radios have a dedicated packet connector (5 pin DIN). Does this work at 9600 baud or are modifications necessary?
In general, would this be a good radio for experimenting with packet?
Are there any other kit manufacturers that offer similar radio kits?

Thanks in advance,
-Ross

(still awaiting my call sign)

BTW: Is there a list (available via FTP or otherwise) of public access NNTP servers? The server my college connects to by default doesn't work very well and also doesn't receive many of the newsgroups.

3005. Conversd v1.4A

From: dlm@g7led.ampr.org
Message-ID: <CvqoGy.CLy@g7led.ampr.org>
Source record: 47550

Just uploaded into ftp.ucsd.edu /hamradio/packet/tcpip/incoming as
'conversd.v1.4A.tgz'

*** THIS IS AN ALPHA VERSION 1.4 ***

This is a version of conversd 2.55 that with distributed with WAMPES 931001,
its since been modified to include a great number of new features.

Linux is the only supported OS at the moment.

This is a redistribution of the standalone package, it does not specifically
require the WAMPES931001 distribution to be run, it *should* work with the
latest version of WAMPES just as well.

To hopefully be found in /hamradio/packet/tcpip/wampes/.

Many Thanks go to the WAMPES team for producing the original code.

The problem, however is <not> with the high end components, but with the low end ones. The G3RUH uses a spectrum folding technique wherein some of the high end portions are folded below 500 HZ.

Given that, do you still think the RC time constant should be shortened?

3008. new version of dsk-loader for the macintosh

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-07 08:25:54 UTC
From: G.POLDER@CPRO.AGRO.NL
Message-ID: <9409070825.AA01397@ganges.cpro.agro.nl.agro.nl>
Source record: 47553

I uploaded version 1.1 of my TI-DSK loader for the apple
macintosh to the info-mac archive (sumex-aim.stanford.edu and his mirrors).
It can be found in /info-mac/app/dsk-loader-11.hqx.

you also can ftp it from oak.oakland.edu (/pub/hamradio/mac/digital),
and from ftp.funet.fi (/pub/ham/dsp/320C26).

Here is some information:

DSK_Loader 1.1

DSK_Loader is the Macintosh equivalent of the DOS program DSKL. With
this program you can communicate with the DSK (DSP Starter Kit) from
Texas Instruments. This program bootloads a simple communications
kernel and then loads other software using this kernel.
Other options are:

* Fill DSK memory with a certain value.
* Dump DSK memory into a textwindow, for further processing.
* Execute programs on the DSK.
* Graph output from the DSK.
* Act as a dumb terminal to the DSK.

changes since version 1.0

- fixed crash when scrolling in 32 bit memory mode.
- fixed hangup of PowerBooks when downloading to the DSK.
- enhanced graph window with offscreen update, grid, and
background which can be selected by the user by setting
misc options.
- some cosmetic enhancements, better errormessages etc.
- added a few more .dsk files.

The DSK and thus DSK_Loader is most interesting for people who want to
experiment with Digital Signal Processing at low costs. For HAM-Radio
operators it is a very interesting piece of equipment, Some
applications, like the KC7WW port of the W9GR filters are included.

Gerrit.

3009. 8bit PMS for TNC-2

Newsgroup: rec.radio.amateur.digital.misc

You might try the Kantronics KPC-3 or their new KPC-9612. Both are quite small and can be powered by a standard 9 volt battery. The KPC-3 (the one I have) can also accept DC power from 7.5 volts to 15 volts, so powering it off of the 13.8 in your car is possible.

Hope that helps,

Isn't that the shirt pocket-sized one? I don't need something
that small :) I have a scanner and an uncomplicated CB mounted
underdash side by side. I would like to install a TNC similar
in size alongside those two. I have an HTX-202, so I'd
want a quick (dis)connect. Hell, I'd like to see the
front panel consist of a 9 pin serial port, an RJ45 jack,
and a push-in push-out power switch!

I would think that supersmall designs are more expensive..
catch my drift?

Thanks for the reply.

If you can tolerate it being *much* smaller than most mobiles, try the
Kantronics KPC-3. Takes almost no power at all and is about the size of
a pack of Player Cigarettes.

Hello, I am doing a telemetry project and I am curious if this will work.

We want to transmit a audio fsk digital signal to the ground. Now, on the ground can we just buy a regular 70 cm band receiver and will it spit the same digital audio tone out of the back, and then from there is it possible to use some sort of tone decoder or modem/tnc to then change the tones into a digital output which can then be feed into a computer I/O device.

I am looking for some information about if this design will work, and if so what are some specific products that we can buy and where can I get them.

Any Help Please.
Thanks, Bill

If you can get a copy, I wrote an article in July 1989 CQ magazine
that discusses mobile packet radio and some possible mounting
solutions.

Did you want to actually mount it under the dash, or do you have some
other place chosen? Is it a car, truck, or van?

Post your results if anything interesting happens.

Hi Joe,

We have a budding new 9600 user community here in Atlanta; I haven't heard anything good or bad about the IC281; I could, however, give a strong endorsement of the Kenwood TM733a. It is excellent for packet! 9600 receive sensitivity is excellent, and produces a strong and coherent eye on transmit.

As for TCP/IP activity...don't have much info there. But you might want to monitor 441.0MHZ, the national digital calling freq. for 70cm. Also, try looking up the DX Cluster guys in your area; they typically are quite active on 9600, but not using TCP/IP.

Good luck and stay in touch,

Steve,
I would look at the KPC-3 or KPC9216 (I might have the second model number
messed up - it's the 9600 and 1200 baud small TNC from Kantronics).
The KPC-3 comes close to the front panel you describe - a push on push off
power switch. The rear panel has a db-25 for serial, a db-9 for radio,
and a coaxial power connector. You can power the thing from the 25 pin
or 9 pin port, a 9V batt, or the coaxial connector. The top cover is
attached on the sides by 2 screws that you could use to mount the thing
next to your radios.

>->
>-> Gentlemen:
>-> You want to SHORTEN the PLL time constant. The highest
>-> frequency
>-> that can be modulated is related to 1/time-constant!

Ray is quite correct. This is why MX*COM, for example recommends the
use of "two point modulation". What this means is that you modulate
both the VCO and the reference oscillator. Modulating the reference
oscillator restores the (necessary) DC response that the PLL always
cancels out.

Be careful before you start tinkering with the loop filter. Make absolutely
sure you understand the loop characteristics (VCO gain, phase detector gain, etc.).
Also understand that reducing the loop corner frequency involves a trade off
with loop settling time and damping. Don't just start changing things without
understanding what they do. A poorly modified PLL transmitter can be a real
problem for other amateurs.

>The problem, however is <not> with the high end components, but with the
>low end ones. The G3RUH uses a spectrum folding technique wherein some
>of the high end portions are folded below 500 HZ.

What? It is true that the problem is with the low frequency response. MX*COM
has several interesting graphs in the MX589 (and other) data sheet(s) which
relate TX and RX low end cutoff with BER for 9600 baud baseband modulation
(such as K9NG, G3RUH, TAPR, MX589, etc.). It shows empirically how much a
poor DC response kills the BER.

But, what is this about the G3RUH modem using a "spectrum folding technique" ?
Can you please elaborate?

>Given that, do you still think the RC time constant should be shortened?

I think the loop filter in most radios I've looked at is already a pretty
good compromise betweem loop settling time (lock-up time) and sideband
suppression. You probably really want to modulate the PLL reference oscillator.
However, be careful doing this; it means turing the xtal osc your radio
almost certainly has into a VCXO. This can cause the reference to be very
sensitive to changing temperature, power supply noise, etc. Be careful!

3029. CODECs and VOCODERS for digital speech

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-08 04:15:13 UTC
From: brian@nothing
Message-ID: <199409080415.VAA23511@nothing.ucsd.edu>
Source record: 47573

I'm interested in using digital speech encoding to link some repeater systems together with toll-quality audio and using links of about the same bandwidth as analog voice circuits. Any pointers to suitable CHEAP vocoders/codecs and suchlike would be appreciated. (So far the cheapest chipsets cost around $150 or so and I'd really like to do it for less than that if I can!)

3030. HDLC protocol chips

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-08 06:31:44 UTC
From: kenth@u.washington.edu
Message-ID: <34mb4g$7n9@news.u.washington.edu>
Source record: 47575

I've been working on a homebrew tnc design for a while to convert an old 8-bit atari to a tnc. I had designed the system around using a Western Digital 1933 HDLC chip, but when I went to buy one about a year ago, WD told me they don't make it any more. Soo.. after looking around I thought Zilogs Z8530 (as used in other TNCs) should work, but when I tried to call them to get the technical specs the numbers I found for them didn't work (ok i got them out of 1983 book). The Motorola 6854 doesn't have an internal PLL clocking mode. Does any one know where I can either

1. Get a wd1933 with specs
or
2. Get a hold of Zilog
or
3. Another chip that might work?

Thanks for the help

kenth@u.washinton.edu

3031. Searching English or French Language Doc for BayCom 1.50

Newsgroup: rec.radio.amateur.digital.misc

Hi.. your question is a bit vague but think you might want to work RTTY Kwhich comes in many forms. First of all you'll need an interface now called a Terminal Node Controller or TNC These are the following AEA's PK232mbx, Kantronic's KAM plus and MFJ 1278 TNC's also you'll need software although you can operate the TNC with a common Terminal program using the built in generica commands..All TNC's generate AFSK (Audio Shift Keying) although using the 450 with the FSK is much better as when it that mode you can also utilize the builin (if you have it installed) CW 500hz filter. The common frequency where RTTY takes place is 14.065 to 14.090 mhz. The various modes most commmon are Baudot,Amtor and Pactor the latter being the most popular by today's standards.. if you have a computer and wish to have a program to operate the PK232mbx which is my choice for an inexpensive all mode TNC, all you need do is send me a high density 3.5 disk along with 3 29 cents stamps to cover postage and I'll make you a copy of the "Shware-ware" program titled XPCOM 1.53 which in my opion is the best out there. My address is as follows...
Jim Jaffe WA2VOS
141-08 71 Road
Flushing NY 11367 please include a note telling me you want XPCOM 1.53
Good luck and 73

If the packets are short and the EPROM large, you could encode not just the
bit-patterns but the tone-patterns, driving the EPROM into a DAC (perhaps just
a resistor network) rather than a tone generator.

A 256 byte packet is about 2 seconds long - if you digitise at 8800 samples
per second, you'll fit over 7 seconds into a cheap 512k EPROM.
A better output filter might let you get away with 4400 sample/s and
4-bit samples, giving 28 seconds (14 different packets) in the same size ROM.

A single-chip micro could probably do an even more efficient job without
increasing the chip count.

>/Peter, SM0OHI
>

It would seem to me that the best way to boost thouroput would be to
have some TNC2 firmware that just converts the syncronous data stream
to an asyncronous data stream at a slighly higher baud rate. So we would
just have a straight through data conection with all the AX-25 (or something
better) done on the computer.
A reply to a recent post about asyncronous radio modems mentioned that
there is software available for satalite use. (are these modems V29?)
I don't know if this software does AX-25. But it shouldn't be too
hard to modify the baycom program or make something else under NOS that
just blows everything else out of the water!!

Source record: 47591

Hello and thanks for reading this posting.

I am having much trouble getting my JNOS v1.10a to work properly on my true blue IBM PC-AT. It doesn't want to RECEIVE anything from the TNC, but apparently has no difficulty transmitting! I use the ASYST command in JNOS and get nothing but zeros in the Rx section!!!

The thing that puzzles me is that the very same hardware (computer, cable and TNC) works fine with both PROCOMM and the 901120 version of KA9Q NOS. In fact, the same ATTACH commands are used in both KA9Q and JNOS.

I have tried different params in the AUTOEXEC.NOS and I have reset the KAM with no results!

If you can help me, please send an email to me. I'd love to hear from you!

MANY thanks, in advance.

> -Micah-

Micah, I can't e-mail you directly because you didn't append your e-mail address, and the digester (I subscribe to the digest) strips your return header.

Meanwhile, few humans can handle the output of a KISS TNC in the raw on a terminal, you need still another layer to implement the AX.25 protocol and/or TCP/IP. As I recall from the SoftKiss docs there was once a plan to expand SoftKiss all the way to TNC emulation. Don't think that was ever done, and that is exactly what you would need to use land line terminal programs.

Savant is a commercial ($50) Macintosh AX.25 via KISS packet program. It has to have its TNC in KISS mode, and SoftKiss is referenced thru out its manual.

And you've already hinted at Mac/Net (or is is NetMac?) which is a freebie. You should be able to find it at ftp.ucsd.edu:/hamradio/packet/tcpip/incoming:
-rw-rw-rw- 1 7 7 202154 Aug 29 07:35 IM_Mac1.0b28b.sea.hqx
-rw-rw-rw- 1 7 7 501 Aug 29 07:34 IM_Mac1.0b28b.sea.hqx.text
-rw-rw-rw- 1 7 7 383211 Jul 25 12:54 NET_Mac2.3.43.sea.hqx
-rw-rw-rw- 1 7 7 1218 Jul 25 12:49 NET_Mac2.3.43.sea.hqx.text

Or better yet, oak.oakland.edu:/pub/hamradio/mac/digital,
-rwxr-xr-x 1 wy1z barc 94720 Feb 13 1992 BeginTCP.sit.hqx
-rwxr-xr-x 1 wy1z barc 202154 Aug 29 02:40 IM_Mac1.0b28b.sea.hqx
-rwxr-xr-x 1 wy1z barc 501 Aug 29 02:39 IM_Mac1.0b28b.sea.hqx.text
-rwxr-xr-x 1 wy1z barc 213764 Jan 29 1993 NETMacenvironment.sea.hqx
-rwxr-xr-x 1 wy1z barc 383212 Jul 25 10:57 NET_Mac2.3.43.sea.hqx
-rwxr-xr-x 1 wy1z barc 1221 Jul 25 10:57 NET_Mac2.3.43.sea.hqx.text

because you really need NETMacenvironment to get your initial directory tree (folders) set up. And you'll probably find BeginTCP.sit.hqx to be helpfull.

3042. Please answer this Digital question!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-08 16:41:44 UTC
From: mgalatz@panix.com
Message-ID: <mgalatz.1129430144B@198.7.0.1>
Source record: 47586

Is it possible to create a software application that would eliminate the need for a radio modem: In other words, just taking the sound from a radio and putting it into the sound input on a Mac, letting the software do the rest.

Why couldn't such an idea work?

mgalatz@panix.com

If properly written, FTP should NOT know or care about timeouts. FTP uses TCP, a protocol which provides connection oriented service over IP. TCP works on networks of any speed, including the terribly slow.

Now if someone who wrote a Windows version of TCP/IP and friends though they were doing users a favor by not implementing the standards properly, it'd be time to find another protocol stack provider.

There is no way for your FTP to know simply be the fact that its local connection is on a high speed network that there will not be a low speed segment somwhere on the internetwork it traverses. Most corporate links to the internet, for example, are at 56Kbps. Get a few folks doing file transfers, and that's loaded up. The TCP protocol can deal with that...

There should be no reason why a properly implemented TCP/IP stack and applications set cannot run over packet radio at 1200 baud successfully. This goes for implementations on Unix, Windows, VMS, or whatever other OS you can name. One of these days perhaps I'll get to implement an AX.25 encapsulator for one of my company's router products!

Dan

The 9612 is like the KPC3 (same casing) but has dual-ports - one for 1200
baud, the other for 9600. You could connect to your favorite AX.25 PBBS
via the 1200 baud port, while ftping or telnetting to an AMPRnet station
at 9600 baud via the other port. QST performed a review of it (and other
9600 baud TNCs) in the Sept. 1994 issue.

>Anyone have comments on it?

I have never used it, so I cannot comment on actual performance.

>transmit/recieve? I haven't a clue as to what other have done or are doing
>so any and all comments would be appreciated. Thanks!

Vince,
I have used my th78a for 1200 baud packet for a while now
and find it to work very well. You can wire up a cheap
cable with the mini plugs (radio shack) and any multi-
conductor cable, and a db-9 or whatever your tnc uses.

I use a kpc-3 with several mini-terminals and i can back pack
the whole thing. Also, it works fine mobile.

I don't know if it will switch fast enough for 9600 baud
but i suspect that it will not. and bypassing the ptt is
for those with more money.....

Some years ago Henry Radio marketed a mobile tnc/printer (12v of course).

The printer was only 40 columns and I think thermal, but the whole
package was therefore rather small. I have been considering buying one
but have only seen one on the net recently. The price for that unit was
$100.

It seems as though something like this might answer your needs.

Try setting your RTS and DTR to 1. This would be:

param portname 8 1
param portname 9 1

Your TNC may think that the computer is not ready to receive data, so it isn't sending it. If this doesn't work, then please let me know...

I am running a real basic system right now. I have my system configured for a one port, 1200 baud, radio. The system works fine, but it tends to lock the computer up every now and then, and I can't figure out why.

I've tried turning the watchdog timer on, especially because the system is a remote system, but it's been down for two days now, and the watchdog timer is 300 seconds! Any other suggestions on how I can keep it online without putting it on a timer to reset the computer every day? It seems like it will run for a few days before it locks, and it usually locks up with plenty of memory (50k or so, but DOS is loaded low). Would it help to load DOS high, or wouldn't it really matter in this case? Any suggestions?

Thanks - Matt

-> Ray is quite correct. This is why MX*COM, for example recommends the
-> use of "two point modulation". What this means is that you modulate
-> both the VCO and the reference oscillator. Modulating the reference
-> oscillator restores the (necessary) DC response that the PLL always
-> cancels out.

Thanks for the reply, Dana. I would very much like to avail myself of info. from this MX*COM organization. Who are they, what are their products, and how do I reach them?

As for the spectrum folding technique, I'll find the reference doc. from G3RUH that made reference to the technique. The whole concept is refined by the G3RUH's capability to store waveforms in ROM, and allow the user to selectively retrieve them. Further, custom waveforms can be burned into a different ROM and used, also. My elmers here tell me that if you're using the G3RUH as a digi, using such options defeats the original purpose: the ability to send and receive to a wide variety of data transceivers.

I look forward to the info. on MX*COM.

To which I reply:

Yes, you _could_ do it. But are you _really_ prepared to do all of the
A/D conversions, then parsing each octet and writing a device driver to
handle it, and then writing the link layer code, etc., etc. ? Even if
you were capable of doing it, would it really be worthwhile?

Also, while I'm not familiar at all with the Mac architecture and the
capabilities of your system, it seems to me that there would be a fairly
significant performance burden if all this were done in software.

I'd rather spend the energy trying to break new ground that would be of
more general benefit. For example, at the moment, I'm looking into what
it would take to build a system capable of routing multiple TCP/IP
56kb circuits. My purpose is to take advantage of the hill I live on to
relay between southern NH/northern Mass and Maine, Vermont and northern
New Hampshire, and then extend it to Quebec if possible. But, that's just
my personal opinion, FWIW.

Has anyone given any thought to using the internet to transport DX cluster spots? I was listening to my local node last night, and it seemed to me that that sort of information would lend itself to long haul tunnelling through the internet. It would also be neat to have a server available online to see DX during the day...:-) I was thinking maybe a slick X interface, or a WWW page with a map and all.... What do you think? Would it be worth writing some code and sticking a TNC in the air? To start with we could just have one large collection of "listens" without retransmitting spots. That could be added later. Naturally you could choose which regions and servers you'd want to accept..Here in Va I don't care about MooseJaw's DX!!!

the KPC-9612 is Kantronics' new dual port 1200/9600 baud TNC. It's supposed
to be around $200 bucks but I could be wrong. Someone else want to chime
in with a correct price estimate?

In order to get soft kiss to work you really need net/mac or (perhaps, I
havn't used it, Savant). Soft kiss emulates a tnc command set but seems
incomplete. I use it with net/mac on a powerbook 100 with no problem and
the tiger tronics tnc. Monitor your transmission to ensure you are not
overmodulating or undermodulating - set the mic gain control on the tnc as
needed. It is important to seperate the antenna from the computer by about
6-10 feet however. you can find net/mac as follows (curtesy David Kelly):
Or better yet, oak.oakland.edu:/pub/hamradio/mac/digital,

As sysop or manager you can use the "NODES * *" to display what you want.
See the documentation (OVERVIEW file) section 3.9 for additional info.

: 3. Anyone have any experience with the new Pac Comm "Sprint" tnc? Good,
: bad?
Does anybody know what IC is used for the coaxial driver? The data rate on the
coax port is tied to the data rate of the RS232.

: 4. Anyone have any recommendations on inexpensive 440 transceivers for 9600
: baud links?
I have used the TEKK data radio's. They cost about $100 plus crystals and are
small. With a few mods these rigs work quite well at 9600. An upcoming article
in the NEDA Quarterly will give more details of these rigs. The article
was submitted January 1994.

|> faster/better for not too much more....
|>
|> Anyone have comments on it?

Has two ports, one 1200, one 9600.
You can use both ports at the same time.
About the same size as kpc-3 ... little bit wider and deeper.
Works fine (we have 3 or 4 in our network now).
Cost is $200 ballpark - perhaps $199.
So for roughly twice the price of a kpc-3, you get 1200
baud PLUS 9600 baud, and can run two radios with it.

Pretty much the ideal tnc for network switches ...

in with a correct price estimate?

I read the latest QST last night and called around to some places, and
that was about the right price. (and have literature on its way from
Kantronics)

Does anyone have any comments about this being a good TNC to start
with? I'm just getting into packet radio, and want to do both AX.25
and TCP/IP. Right now all I have is my computer (a Mac) and a 2m HT.
I'm pretty good with computers, but horrible at electronics, and the
review in QST indicated some problems with setting up the deviation,
and needing special equipment..... I'm nervous that I may not be
able to get it to work. Would the KPC-3 be a better starting choice?

Hams, in general, are too cheap and the market is too small to justify some manufacturer trying to build one now. If you want a TNC to use with your laptop, the KPC-3 plus a serial cable is something you can buy right now and you're on packet for less than $120. The equivalent PCMCIA card (if it currently existed) might cost $500 to $1k.

Hint: when you post looking for equipment, state where you are.

This newsgroup goes out world wide. If you're in Denmark, someone
with a spare Model 15 (like me) in Southern California wouldn't do
you much good.

But, on the odd chance that you are local, and are interested in some
living history boat anchors, I have a Model 14 pair and a model 15
available. The actual tone generator and receiver (called a TU, for
Terminal Unit) can be acquired thru the QST / 73 / etc want ads.

You might want to look at Motorolas new 68360. I think it has a HDLC
interface as an option at least. It's a pretty nifty chip, it has a 68K CPU,
4 serial channels, timers, two parallel ports, dynamic ram support, and an
onchip RISC CPU to handle all the I/O stuff. I'm not sure about the price,
it's probably something like $150. Call Motorola and ask.

Seems like to be useful, users would need to have live connections to the Internet which aren't all that common. Another way might be via IRC (Internet Relay Chat) which allow users to connect to an IRC server when interested, and look for a channel called DX or some such. Using IRC would mean that anyone with a cheap interactive account could use it, it could be used both for talking and listening and there would be no need to write any significant software (someone could get started with any simple terminal program).

Whaddya think?

I don't know for sure, but I had always thought that it was because there would be no certain way to keep non-HAMs out... It would end up to be a pain for the Sysop to do such a thing for all of the HAMs on the internet that would want access...

There are a number of restrictions on packet why this cannot be used,
certainly in the UK, and I suspect many other countries, also most
packet still runs 1200 baud, amazingly slow in comparison with the net
!!

3087. [Q] packet TV; broadband IP coder to TV signal?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-10 17:29:00 UTC
From: ko@komac.knoware.nl
Message-ID: <ko-100994172900@193.78.122.105>
Source record: 47637

Have there been any experiments;

It resembles VCR backup for digital data.

A minimal packet would be a bitstream encoded into a regular TV signal frame with sync, error correction, address etc. . Maybe some teletekst(see note) technology could be used for this not only for the top video lines but for the whole "picture" frame / packet.

NOTE: Teletekst is a system wich uses the top video lines (invisible) to broadcast digital data to all tv sets continuously; the user selects from the carrousel pages to read.

>kenth@u.washinton.edu

Advanced Micro Devices also manufactures the Z8530 as the Am85C30. Call
1-800-222-9323 and ask for the Am85C30 Data Sheet and the Am8530H/Am85C30
Technical Manual. The AMD CMOS part has some enhancements useful for high
speed HDLC operation.

Intel also manufactures the Z8530 as the 82530. You can call them at
1-800-628-8686 and ask for their data sheet, but I found the information from
AMD more useful.

I obtained 8530 literature from both AMD and Intel just a couple of weeks
ago, so both of the 800 numbers should still be good. Most hobbyist component
vendors sell Z8530 or Z85C30's. Newark Electronics catalogs the AMD CMOS part.

Another device you might investigate is the 82520/82525/82526 series from
Siemens. (AMD used to make these, too, but I don't know if they still do.)

These have selectable bus structures that match either Intel 8080 or Motorola 6800 bus arrangements. The latter would probably match the 6502 in your Atari better.

A third possibility is to throw away the Atari :-) and use one of the new microcontrollers with integrated HDLC. Intel sells the 80C152 and Zilog has a device (whose part number escapes me at the moment) that includes Z80, glue, clock generator, and half a Z8530. National Semiconductor catalogs a COP1600 variant with integrated HDLC, but if I remember right it doesn't have the DPLL for clock recovery.

: Bob N2KGO

Hi Bob,
The KPC-9612 would be my choice if I were buying today. The ability to operate 1200 and 9600 baud simultaneously is a big plus. May not be important to you, but it's really like having two independent modems in one box.

For 9600 baud, they all require precise deviation adjustment. You're also not likely to run 9600 baud with your HT (not a trivial mod). I see another radio in your future :-)

What's even more astounding is that packet hasn't taken advantage of the
many inexpensive or free DOS based uucp news and mail forwarding systems
to allow for, for example, newsgroups instead of having every subject in
one main group. Waffle, for example, ought to work very well over Packet,
and runs on any DOS machine, even XT's.

Oh, goody. What budget? :-) What should I be looking for in a new rig?
I know newer rigs can switch faster, which is a major plus, but what about
the "packet ready" radios? Are those worth the money? What is it?

Can you attach the KPC-9612 to a HT and run it at 1200 anyway? I have
visions of plugging a 9-volt into the TNC, and taking my HT and Newton out
and run packet away from the apartment. :-)

Also, can the KPC-9612 do HF packet?

In a previous article, esh6n@brain.neuro.virginia.edu (Ned Hamilton) says:
>
> Problem is getting the code writted and into the
>field and then what's the incentive for people to post spots?
>
I think your last point is the most important issue. How many of us have a full time link to internet while sitting in front of our radios? Without people sitting next to radios, who is going to generate these DX spots? And if you are at work or the university lab, are you in any position to do something about a new country that is spotted someplace else in the country? If you are at work, what DX spots can you contribute? PacketCluster only works when we have people tuning the bands and sending DX spots.

Using internet to link remote cluster nodes makes sense to me if there is no direct radio path. Sending those spots to users dialed in to internet does not.

The problem is one of content. Amateurs are not permitted to broadcast messages of a commercial nature. Even under the relaxation of the rules which ocurred earlier this year, it would be a real nightmare to try to keep out some of the commercial garbage (did you see the ad from the attorneys trolling for business?), and the newsgroups and ircs which deal with sexually explicit material.

In short, the technology's available, but the content problem hasn't been solved. (without a great deal of monitoring)

I've heard it suggested that you can run the Unix version of NOS attached to a pty that is connected to a pty running slip. In this way, NOS is connected to the "real" networking built into the Unix kernel without the need for a ax25 streams module, a separate machine, or wasting two physical tty ports.

Does anybody know how to do this? I have a running version of NOS on SVr4 Unix. I have SLIP installed in that Unix. Both work. How can I connect them together?

I think the suggestion was to use IRC as a DX spot on it's own, not to
gate it to the radio. Nothing illegal about that.

I'm planning to upgrade to a newer Sharp Electronic Organizer... It says through the use of one the above interfaces and a null modem adapter (depending on which one) I can hook it up to an external modem and call online services.

Well, I figure I'll just get one of these and hook it to a TNC and become a portable packet station.

Can somebody suggest a source of these interfaces? I can't seem to find any one locally that carries it. I don't want to upgrade to a newer organizer unless I can find the interface first.

If you can afford the cost of the KPC-9612 now, then buy it now, or you'll regret it later. The point here is that it does have both 1200 and 9600 baud capability, and they can run simultaneously. This means that you could get started now, using only the 1200 baud port, and easily move up to 9600 baud with another rig later on.

This is exactly what the KPC-9612 and older KPC-3 are really good for. Running low power, in the field, on batteries only.

>Also, can the KPC-9612 do HF packet?

A resounding NO, comes to mind here. This is only good for vhf and above due to the modulating frequency shift size. It results in too large a bandwidth for use on hf bands...

3105. VHF packet "talk" range

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-12 23:03:47 UTC
From: barrusc@yvax.byu.edu
Message-ID: <1994Sep12.160347.9245@yvax.byu.edu>
Source record: 47504

Can anyone tell me if it is possible to "talk" via packet VHF over long distances by linking digipeaters? What is the longest distance?

I am looking to getting into packet and was just curious. 73's

Craig

>I've tried turning the watchdog timer on, especially because the system is
>a remote system, but it's been down for two days now, and the watchdog timer
>is 300 seconds!

The watchdog timer works by detecting that the timer process is blocked
when the hardware timer interrupt ticks. If timer interrupts are blocked
(usually because all interrupts are off), then the watchdog code doesn't
run.

> Any other suggestions on how I can keep it online without
>putting it on a timer to reset the computer every day? It seems like it will
>run for a few days before it locks, and it usually locks up with plenty of
>memory (50k or so, but DOS is loaded low). Would it help to load DOS high,
>or wouldn't it really matter in this case? Any suggestions?

If you load dos high then you will get some extra memory. What is going
on when it locks up? Does your caps lock key work? Can you type more
than 16 charactesrs without getting beeps? Can you use the 3 finger
salute or do you have to press the hardware reset button?

One thing you can try is reducing features. Compile out code you don't
need, don't start more sessions at the same time than you need, keep
an eye on sockets where the other end died, etc. Consider doing a
software exit/restart or reboot every x hours as a preventitive measure.

Another choice that is equally drastic software wise but is easer
on the hardware would be to put a connection that activates the
reset line. You could even hook it up to do it remotely (on 440
or above) instead of on a timer. Or make a hardware watchdog that
activates the reset if you don't write to it within say 5 minutes
and add that to the timer loop.

3107. WNOS memory leak?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-13 03:40:01 UTC
From: russell@gonix.com
Message-ID: <russell.779427601@gonix>
Source record: 47501

I'm running WNOS (Title line WNOS.4A9.DB3FL) on my packet machine, and I love it, but it seems that the memory just continually goes down when I leave the machine on for any length of time. I've tried shutting the trace off, set the ax heard list to the last 25 only, etc etc, but still it just goes down.

Is there a memory leak somewhere, or is the system just letting things go until it gets low enough, at which point it will garbage-collect and free things up? I haven't left it on and watched it to see. I'd like to set up a remote routing system, but not if it's going to reboot quite often due to memory problems.

>wasting two physical tty ports.

>Does anybody know how to do this? I have a running version of NOS on
>SVr4 Unix. I have SLIP installed in that Unix. Both work. How can I
>connect them together?

Yes, I'm doing this now with JNOS 1.09a4 for Linux. I first fire up a SLIP
session to the master side of the PTY on the Linux side and then put the
appropriate commands in autoexec.nos to configure a SLIP port on the "slave"
side of the PTY in JNOS.

Works great; less filling. Your mileage may vary. Etc.

I can e-mail you the appropriate stuff from the Linux and NOS sides but if you
think it will help.

Message-ID: <353e39$i6u@muscle.frc.maf.govt.nz>
Source record: 47500

Second sources for the 8530 Serial Comms Controller (SCC): AMD and SGS Thomson.

The NMOS 8530 is the least expensive, a mail order place in VK sent me one for app. $30 US, you should be able to get them for much less in the States. The CMOS versions are at least twice that. You could also consider the 85230 ESCC which has a deeper RX FIFO, is more forgiving of timing problems, and has less funnies and teething problems.

Zilog Support Products offer an 85230 evaluation kit with examples of source code, header files etc, a simple PC bus card and the User Manual.

The sheets in Zilogs volume 1 uProcessors and Peripherals are good as a reference only and are very condensed; to successfully program the SCC you'll need the SCC User Manual, in particular HDLC...

I have had no problems dealing with Zilog in the US, they promptly referred me to the local agent :-) At work, I use 85C30's in ASY mode in a serial link at 128 kbps of speed through a 600 m long tow cable. Have no experience with HDLC/SDLC modes. Hope this helps, good luck.

I'm not too "up" on interrupts, so forgive me if this sounds a little off...
Is there a way that this can be fixed, without rewriting any of NOS? Whatever
it takes to get it going is pretty much worth it I think...

>If you load dos high then you will get some extra memory. What is going
>on when it locks up? Does your caps lock key work? Can you type more

>salute or do you have to press the hardware reset button?

Sometimes the 3 finger salute works, other times it doesn't. I haven't loaded
DOS high yet because I'm not ready to tackle a new set of variables... I will
start paying more attention to it when it locks up...

>One thing you can try is reducing features. Compile out code you don't
>need, don't start more sessions at the same time than you need, keep
>an eye on sockets where the other end died, etc. Consider doing a
>software exit/restart or reboot every x hours as a preventitive measure.

I've thought about rebooting every x hours, but locally, TCP activity (FTP, etc)
is active (for the most part) 24 hours... To reboot would most likely knock
someone off, so I'm leaving that as a last resort...

I can't recompile the code (not into C - yet). I've had the system running
for up to 10 days (when I forced it to reboot), while other times it makes
it about a day or so. It usually goes for quite a few days, and when it locks,
it still has lots of memory left (40-50k, which is about what it runs at
anyway)...

>

Any other suggestions anyone? I'm willing to try just about anything, and
please make the answers as descriptive as you want...

73 and thanks to all!

I just finished setting up my Newton with PocketCall, a KPC-3, and an
Alinco DJ-580. Works like a champ. I do not see any reason why a KPC-9612
wouldn't wok as well (it is a little larger than the KPC-3). I don't
think a KPC-9612 works on HF.

3120. mfj 1270c/1274c modifications for the net software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-14 04:46:46 UTC
From: kadams@peinet.pe.ca
Message-ID: <QRbTk4JnhYtH071yn@peinet.pe.ca>
Source record: 47516

hi,
here are a bunch of mods to use the mfj 1270c/1274c with htenet
(tn2.08b in particular).

these were developed setting up 32 tnc's for a packet network in
atlantic canada.

to use this tnc with the net software it is necessary to make several
modifications to the pc board as well as the removal of several chips.

1. remove the circuit board from the chassis
2 front and 4 side cover screws
4 screws holding the pc board to the chassis
1 screw holding regulator to chassis
2. remove u23 eprom
3. remove u24 sram (option may not be installed)
4. remove u40
5. cut jmp x
6. remove jmp 9
7. depending on your node wiring you may have to install
r14 and r15 100 ohm
8. on u40 connect pin 16 to pin 1
9. install new eprom in u23 socket
for a 27x512 remove jmp 15 then connect jmp 15-2
to ground

for a 27x256 strap jmp 15 1-2
10. reinstall the pc board in the chassis
11. connect a terminal to the serial port of the tnc
12. apply power
13. reset the tnc to force it to load the new bbram values
14. the tnc should display a sign on message.
15. try to connect to the tnc (via serial port) to verify operation
16. put modification record label on inside of cover and reinstall it

good luck

3121. RE:DSP Units

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-14 05:48:26 UTC
From: ggs@eule.lanl.gov
Message-ID: <355irt$ath@newshost.lanl.gov>
Source record: 47464
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I have a DSP-59+ and an NIR-10 currently being fed in parallel.
The current test are subjective on satellites and some DX HF.
The next step is to take the output to my Soundblaster and digitize
the output into the two stereo channels. The resultant will undergo
some analysis to try and determine signal to noise ratio. I was going
to put an MFJ in the test also but they would not sell me one at the
Jacksonville Hamfest. The dealers do not seem to have them either.
More vaporware from Mississippi. I plan to test ssb and cw as well as
some of the hf digital modes. If you have some suggestions of tests
you would like to see contact me at ggs@eule.lanl.gov. As time permits
the units are going to be loaned to other hams for subjective input.
I plan to ask both hf types and vhf weak signal types to help.
Perhaps this effort will determine just who is King of the hill.
By the way I bought both of the units and have no association with
Timewave or JPS hopefully the results can be published in one of the
ham mags. 73 de Jerry KC5EGG

3122. Autoexec.nos ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-14 10:32:05 UTC
From: dany@arti.vub.ac.be
Message-ID: <dany.73.000A8942@arti.vub.ac.be>
Source record: 47514

I want to get started with wnos4a8 or later. The autoexec.nos
packed in the package seems to have some mistakes in it giving
errors at startup. Can someone point me to an autoexec.nos file
that compatible with this version of wnos. Also, are there
programs (free) available by ftp that have a better user interface
, but with the same functionality.
Also, the program complains that it can't find a number of .dat
files. The manual says they are created by the program after some
time. I haven't seen any changes in this. Should I give some sort
of command for this?

Thanks in advance

dany@arti.vub.ac.be

Yes, it is, but the practise isn't recommended. It is much more efficient to connect to nodes and do it that way. For example you connect to node 1, then connect node 1 to node 2, etc. then node n to whoever you want to connect with. The reason is this: when you digipeat, each acknowledgement packet goes backwards through the chain. Each missed packet has to be repeated through the chain. This means a ton of traffic generated and likely timeouts when you go through very many during busy periods. Using nodes means that acknowledgement packets are limited to each node pair, a big savings.

We've been using WNOS 4b0 (The UK release by Mike Chace, G6DHU) at a
24 hr club station for some time. It's one of the most reliable
xNOS's I've used, and in a suitably cosseted environment will go for
about two weeks before falling over and re-booting.

It's quite good at repatriating core memory, and memory leaks are
very minor. Two things to bear in mind are:-

WNOS only appears to regather core when it is idle, with no tcp,
netrom or ax25 connections active.

Some memory may appear to `leak' because the auto-router is
building an ever increasing table of IP routes and netrom routes
in memory (and saves them as .DAT files).

Having said that, some memory does leak, and if not released to
core at an idle moment, is generally lost until next reboot.

Our 386 system uses in config.sys

DEVICE=EMM386.EXE NOEMS I=a000-afff I=e000-efff

Which gives an extra 64k of `base memory' to the WNOS `core',
and provides UMB for a G8BPQ node to operate in outside
of base memory. Our particular WNOS seems to start with about
228000 bytes of core, which reduces to about 188000 bytes after
a week or so.

Hi

It all depends on what services you want or want to provide. Therefor, I guess, it is best to get the source code of any of the latest NOS versions and compile your own flavour. We here at the Cape Technikon are currently running a packet <> Internet gateway on KA9Q NOS version 930507 compiled for 386/486 CPU. Or you could can have a look at nos11c-a.exe, it has gopher and www services.

The following programmes are now available from,

ftp.demon.co.uk /pub/ham/mac

****

ANT RAD PLOT.sea
2K Basic programme plots vertical radiation pattern for dipoles at
any
given height.

BROADCAST v2.0.sea
150K Packet program for use with PACSATs.

CODEMASTER v1.34.sea
27K CodeMaster 1.34 - demo version of CodeMaster 2.34 - morse code and
ham
theory test application. This version is somewhat functional.

CONTEST DUPER v5.1.sea
70K Checks your contest log for duplicate entries.

CW CHART.sea
3K Copied from Usenet - a morse code (CW) tree chart.

DXCC by Callsign.sea
30K DA which lists all the DXCC countries in order of callsign.

DXCC by Country.sea
30K DA which lists all the DXCC countries.

EZ DOVE v.002.sea
55K EZ Dove decoder (v.002). Appl and Basic source, decodes Dove
telemetry
data.de N5KOB.

GRID 1.0.sea
9K Converts longitude/latitude to grid QTH

HF PACK TUTOR.sea
9K Tutoral on HF packet radio - interesting

HAM ART.sea
11K Assorted ham related artwork. ARRL and AR TIFF logo, IC-735
front(MCDW)

ICOM & MACS.sea
1K Info for Mac & ICOM owners looking for software to link'em

IM/Mac v1.0b27z.sea
200K SMTP mailer for use with NET/MAC.

KISS_TLM.sea
50K For decoding KISS data from MICROSATs.

MacContest 4.0.sea
300K The ultimate contest logging program for the Macintosh (System 7 proof). Covers CW/SSB/RTTY modes and all bands from 1.8 MHz to 5.7 GHz. Allows real-time or post contest logging for a wide variety of contests (30 contest include, new ones can be added). Checks for dupes, figures scores instantly. Offers various printouts (sorts per band, alpabetically, labels etc.) Interfaces to TNCs (KAM, PK-232) for CW, RTTY and packet modes. Built in terminal mode and packet DXcluster interface. Interface to Kenwood transceivers for automatic band/mode logging. MacinTalk voice output for real-time logging as well as to ease post-contest entry. Option to capture log in realtime to printer. Option to simultaneously create a save copy of the log to a different file/drive. Timetable showing actual grayline on a world map. (I have the demo version which will allow you to make 50 contacts). MacContest is free but must be personalized to each user
(otherwis it's limited to 50 contacts). To get a copy send a 3.5" diskette and
a SASE to Gerald Eberle, HB9CEY, PO Box 13, CH-4417 Ziefen, Switzerland. Moritz (HB9BLZ) can act as a message forwarder for Gerald.
Moritz' e-mail address is: gysslerm@saturn.kau.roche.com

MacFAX2 v1.1.sea
20K Will allow you to receive WEFAX pictures in your PK-232.

MACMORSE v0.2.sea
30K Another program to learn morse code

MACMININEC v3.13.sea
250K For analyzing antenna disgins,including dipoles, beams, etc etc.

MORSEMAC DA v2.0.sea
17K A program to learn Morse code . It sounds a preset number of characters
randomly choosen. it contains an XCMD written by LX1YZ

MORSE v1.3.sea
20K Morse tutor up to 25wpm, very good.

MAC SHORTWAVE v1.sea
90K Shortwave propagation predictor.

NET/MacStartersKit.sea
500K A complete starters kit for the Mac user interested in trying TCP/IP.
Includes everything that you will need to get going.

NET/Mac v2.3.39.sea
500K This is a version of TCP/IP. Will allow you to use AX25, NETROM, FTP,
TELNET and SMTP with packet radio
ORBITTRACK (2 versions)
514K This is one of the best Shareware progarmmes I have ever seen. If you are interested
in tracking sats you need this. Comes in two versions, one for use with Macs that have a FPU
processor installed and one which will run without a FPU for those that don't.

PACKET(1-18).sea
43K Introduction to packet radio - Parts 1 thr 18 by Larry Kenney, WB9LOZ

PacketTracker 1.04.sea
110K PacketTracker ver 1.04 is a program that monitors packet activity
and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. You will be able to see graphically what stations you can hit directly and which ones he cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox System 7

PROJECTMAC A1.sea
105K ARRL's Project Mac software - part A1 (These are looking a bit old now)

PROJECTMAC A2.sea
118K ARRL's Project Mac software - part A2 (These are looking a bit old now)

PROJECTMAC B1.sea
103K ARRL's Project Mac software - part B1 (These are looking a bit old now)

PROJECTMAC B2.sea
107K ARRL's Project Mac software - part B2 (These are looking a bit old now)

QUICKTERM.sea
Another of Gerald Eberle, HB9CEY contest/dx programmes. This one is a AX25
terminal programme for use with the DX cluster.

RADFAX 09.sea
173K WEFAX programme that uses the mic input on new Mac. No other

hardware required,
just plug output from HF rig into Mac mic socket and away you go.

SAVANT 1.0.2 Demo
185K AX25 packet terminal programme that will work with SoftKISS,
in other words it will allow you to run a Baycom modem on the Mac.
This is now a commerical programme but the demo version will let you
set it up, send a limited number of frames and see it working etc
etc.

SoftKISS 1.8.sea
This will allow the use of dumb modems with the Mac, ie the BayCom
series
of kits.

STARTING IP v3.0.1.sea
14K The Getting Started with (Mac) TCP/IP text file for beginners

SUNTIMER.sea
130K One of Gerald Eberle, HB9CEY contest/dx programmes. Shows
Grayline
on world map, distance, bearing, DXCC callsign lookup table, very
very nice programme.

TALKTERM 1.1.sea
50K For use with DX clusters. If used along with MacinTalk it will
announce
DX spots as they arrive on the cluster.

Various Logs.sea
200K Includes,
FileMaker Log, 5K FileMaker IV document will provide excellent general
logging.
HamLogger, 10K HC stack for logging ham contacts - very nice.
Logging Stacks UK, 100K Keeps all sorts of logs. From contest, to
local directory.
Logging Stacks USA, Same as above but with USA bandplans.
MacLogger, Very nice programme for checking contest entries.
SWL Logger Stack.

Virtuoso v1.4.sea
68K A very nice standalone packet terminal programme for use with any
TNC

World Radio v1.8.sea
260K Radio control programme for Kenwood radios includes,
Kenwood Radio Interface, Station Log Database, World Map Display,
DX Call Sign List, Antenna Rotor Control, Radio Memory List,
UTC Clock Display, very nice.

World Clock Lite.sea
108K What time is it in Alice Springs Australia ? How far away is
London ?

Is it daylight or night time in New York ? Is it night all the way
from here to Cario?
The World Clock desk accessory has the answers to all these questions
and
many, many, more. Looks good to.

ZTerm.sea
263K Comms Terminal programme for the Mac. Nice and easy to use. Comes
with
sound updates.

****
******

HYPERCARD STACKS.

Advanced 2.2.sea
132K HC stack - Ham advanced test.

CHESS-STACK.sea
143K Yep, someone had to do it. HyperCard stack that will allow two
Macs to play chess via packet radio.

DXMAP v1.1.sea
150K Shows grayline in real time, also has a data base of all
callsigns and
will show location and bearing from your QTH on world map. Very nice.
Can
only can only be used with version 2 or higher of Hypercard.

Extra 2.2.sea
127K HC stack - Ham extra test.

FreqValet Demo version.
203K Provides frequencies and DX program info for shortwave radio
listeners. The program databases update automatically at 15, 30, or
60 minute intervals, thus providing a continuous display of
broadcasts on-the-air at any given time in a spreadsheet like
format. Features include sorting of data, scanning, and on-screen
changing of databases. The program will convert Tom Sundstrom's
dBase shorwave broadcast listing to FreqValet format and will do the
same for Shorwave Navigator users. Separate cards are provided for
DX Programs, Ship to Shore, and Utility broadcasts. Computer
control modules are available at extra cost for the Drake R8,
Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.

General 2.2.sea
93K HC stack - Ham general test.

GRAYLINE.MAC.sea
70K HC Shows world grayline in real time.

HyperFT747GX.sea
250K HyperCard that will allow you to control your FT-747 via the

RS232
interface. This stack should be pretty easy to modify to work with
other
transceivers. It also now comes in a coloured version

Mac525B1.1.sea
100K HyperCard stack for controlling the JCR525 radio via the Mac's
RS232 port. Works pretty fast as the scripts are very well written.
Includes
Database of memories.

Mac5351.1.sea
100K HyperCard stack for controlling the JCR535 radio via the Mac's
RS232 port. Works pretty fast as the scripts are very well written.
Includes
Database of memories.

NOVICE 3.2.sea
128K HC stack - Ham novice test.

SSB.sea
500k With this one you can record your own voice, using MacRecorder
or
similar and then at the click of a mouse call CQ, QRZ, etc etc.

Tech 3.3.sea
108K HC stack - Ham tech test.

Trans.Stk v1.0.sea
32K A stack I made for transmission lines, giving attenuation, SWR,
etc

Various Logs.sea
200K Includes, FileMaker Log, 5K FileMaker IV document will provide
excellent general logging. HamLogger, 10K HC stack for logging
ham contacts - very nice. Logging Stacks UK, 100K Keeps all sorts of
logs. From contest, to local directory.

Logging Stacks USA, Same as above but with USA bandplans.
MacLogger, Very nice programme for checking contest entries.
SWL Logger Stack.

KQI Control v1.sea
53K Hypercard stack that will allow you to control a Kenwood TS-940S
via
it's RS-232 interface. However the author feels that it should work
with most
of the Kenwood range of transceivers.

Macnet rouster v 631
Worldwide database of Ham Macintosh users.

Mac To PC.

ZIP.sea
Will allow ZIP or PKZIP files to be exchanged between Macs and PCs.

3129. Re: mocom 35 on packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-14 18:20:49 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <10652@uugate.wa7slg.ampr.org>
Source record: 47525

We use a UHF Mocom 35 on packet here for the 9600 baud port on
UUGATE (The Univ. of Utah gateway).

It took some significan hacking of the IF to make it work well, but it
now works extremely well. The IF bandwidth is a bit broad (18 KHz) but
that makes it extremely forgiving on the receive signal. The skirts on
the receive side aren't particularly sharp, either, but since we don't
have any adjacent channels to be concerned with, that isn't a problem, either...

As it was originally, it was completely unuseable for 9600 baud packet owing
to narrow bandwidth (approx. 11 KHz) and tremendous ripple in the
1st IF passband (about 10db worth of ripple...)

The 68360 has HDLC firmware in the RISC engine, as well as Ethernet, and UART (async). There are 3 parallel port registers, each pin of each register is special purpose for something, but you never need them all. there are 20 timers, and the price is dependent on quantity. The version with the ethernet firmware costs a little extra.

This is a fabulous chip, with a rather large learning curve to get a successful product completed...

14/9/94

The following programmes are now available from,

ftp.demon.co.uk /pub/ham/mac

All programmes are either Freeware, Shareware or demos.
****

ANT RAD PLOT.sea
2K Basic programme plots vertical radiation pattern for dipoles at
any
given height.

BROADCAST v2.0.sea
150K Packet program for use with PACSATs.

CODEMASTER v1.34.sea
27K CodeMaster 1.34 - demo version of CodeMaster 2.34 - morse code and
ham
theory test application. This version is somewhat functional.

CONTEST DUPER v5.1.sea
70K Checks your contest log for duplicate entries.

CW CHART.sea
3K Copied from Usenet - a morse code (CW) tree chart.

DXCC by Callsign.sea
30K DA which lists all the DXCC countries in order of callsign.

DXCC by Country.sea
30K DA which lists all the DXCC countries.

EZ DOVE v.002.sea
55K EZ Dove decoder (v.002). Appl and Basic source, decodes Dove
telemetry
data.de N5KOB.

GRID 1.0.sea
9K Converts longitude/latitude to grid QTH

HF PACK TUTOR.sea
9K Tutoral on HF packet radio - interesting

HAM ART.sea
11K Assorted ham related artwork. ARRL and AR TIFF logo, IC-735
front(MCDW)

ICOM & MACS.sea
1K Info for Mac & ICOM owners looking for software to link'em

IM/Mac v1.0b27z.sea
200K SMTP mailer for use with NET/MAC.

KISS_TLM.sea
50K For decoding KISS data from MICROSATs.

MacContest 4.0.sea
300K The ultimate contest logging program for the Macintosh (System 7 proof). Covers CW/SSB/RTTY modes and all bands from 1.8 MHz to 5.7 GHz. Allows real-time or post contest logging for a wide variety of contests (30 contest include, new ones can be added). Checks for dupes, figures scores instantly. Offers various printouts (sorts per band, alpabetically, labels etc.) Interfaces to TNCs (KAM, PK-232) for CW, RTTY and packet modes. Built in terminal mode and packet DXcluster interface. Interface to Kenwood transceivers for automatic band/mode logging. MacinTalk voice output for real-time logging as well as to ease post-contest entry. Option to capture log in realtime to printer. Option to simultaneously create a save copy of the log to a different file/drive. Timetable showing actual grayline on a world map. (I have the demo version which will allow you to make 50 contacts). MacContest is free but must be personalized to each user
(otherwis it's limited to 50 contacts). To get a copy send a 3.5" diskette and
a SASE to Gerald Eberle, HB9CEY, PO Box 13, CH-4417 Ziefen, Switzerland. Moritz (HB9BLZ) can act as a message forwarder for Gerald.
Moritz' e-mail address is: gysslerm@saturn.kau.roche.com

MacFAX2 v1.1.sea
20K Will allow you to receive WEFAX pictures in your PK-232.

MACMORSE v0.2.sea
30K Another program to learn morse code

MACMININEC v3.13.sea
250K For analyzing antenna disgins,including dipoles, beams, etc etc.

MORSEMAC DA v2.0.sea
17K A program to learn Morse code . It sounds a preset number of characters
randomly choosen. it contains an XCMD written by LX1YZ

MORSE v1.3.sea
20K Morse tutor up to 25wpm, very good.

MAC SHORTWAVE v1.sea
90K Shortwave propagation predictor.

NET/MacStartersKit.sea
500K A complete starters kit for the Mac user interested in trying

TCP/IP.
Includes everything that you will need to get going.

NET/Mac v2.3.39.sea
500K This is a version of TCP/IP. Will allow you to use AX25, NETROM, FTP,
TELNET and SMTP with packet radio
ORBITTRACK (2 versions)
514K This is one of the best Shareware progarmmes I have ever seen. If you are interested
in tracking sats you need this. Comes in two versions, one for use with Macs that have a FPU
processor installed and one which will run without a FPU for those that don't.

PACKET(1-18).sea
43K Introduction to packet radio - Parts 1 thr 18 by Larry Kenney, WB9LOZ

PacketTracker 1.04.sea
110K PacketTracker ver 1.04 is a program that monitors packet activity
and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. You will be able to see graphically what stations you can hit directly and which ones he cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox System 7

PROJECTMAC A1.sea
105K ARRL's Project Mac software - part A1 (These are looking a bit old now)

PROJECTMAC A2.sea
118K ARRL's Project Mac software - part A2 (These are looking a bit old now)

PROJECTMAC B1.sea
103K ARRL's Project Mac software - part B1 (These are looking a bit old now)

PROJECTMAC B2.sea
107K ARRL's Project Mac software - part B2 (These are looking a bit old now)

QUICKTERM.sea
Another of Gerald Eberle, HB9CEY contest/dx programmes. This one is a AX25

terminal programme for use with the DX cluster.

RADFAX 09.sea
173K WEFAX programme that uses the mic input on new Mac. No other hardware required,
just plug output from HF rig into Mac mic socket and away you go.

SAVANT 1.0.2 Demo
185K AX25 packet terminal programme that will work with SoftKISS, in other words it will allow you to run a Baycom modem on the Mac. This is now a commerical programme but the demo version will let you set it up, send a limited number of frames and see it working etc etc.

SoftKISS 1.8.sea
This will allow the use of dumb modems with the Mac, ie the BayCom series
of kits.

STARTING IP v3.0.1.sea
14K The Getting Started with (Mac) TCP/IP text file for beginners

SUNTIMER.sea
130K One of Gerald Eberle, HB9CEY contest/dx programmes. Shows Grayline
on world map, distance, bearing, DXCC callsign lookup table, very very nice programme.

TALKTERM 1.1.sea
50K For use with DX clusters. If used along with MacinTalk it will announce
DX spots as they arrive on the cluster.

Various Logs.sea
200K Includes,
FileMaker Log, 5K FileMaker IV document will provide excellent general logging.
HamLogger, 10K HC stack for logging ham contacts - very nice.
Logging Stacks UK, 100K Keeps all sorts of logs. From contest, to local directory.
Logging Stacks USA, Same as above but with USA bandplans.
MacLogger, Very nice programme for checking contest entries.
SWL Logger Stack.

Virtuoso v1.4.sea
68K A very nice standalone packet terminal programme for use with any TNC

World Radio v1.8.sea
260K Radio control programme for Kenwood radios includes,
Kenwood Radio Interface, Station Log Database, World Map Display,
DX Call Sign List, Antenna Rotor Control, Radio Memory List,
UTC Clock Display, very nice.

World Clock Lite.sea
108K What time is it in Alice Springs Australia ? How far away is
London ?
Is it daylight or night time in New York ? Is it night all the way
from here to Cario?
The World Clock desk accessory has the answers to all these questions
and
many, many, more. Looks good to.

ZTerm.sea
263K Comms Terminal programme for the Mac. Nice and easy to use. Comes
with
sound updates.

****
******

HYPERCARD STACKS.

Advanced 2.2.sea
132K HC stack - Ham advanced test.

CHESS-STACK.sea
143K Yep, someone had to do it. HyperCard stack that will allow two
Macs to play chess via packet radio.

DXMAP v1.1.sea
150K Shows grayline in real time, also has a data base of all
callsigns and
will show location and bearing from your QTH on world map. Very nice.
Can
only can only be used with version 2 or higher of Hypercard.

Extra 2.2.sea
127K HC stack - Ham extra test.

FreqValet Demo version.
203K Provides frequencies and DX program info for shortwave radio
listeners. The program databases update automatically at 15, 30, or
60 minute intervals, thus providing a continuous display of
broadcasts on-the-air at any given time in a spreadsheet like
format. Features include sorting of data, scanning, and on-screen
changing of databases. The program will convert Tom Sundstrom's
dBase shorwave broadcast listing to FreqValet format and will do the
same for Shorwave Navigator users. Separate cards are provided for
DX Programs, Ship to Shore, and Utility broadcasts. Computer
control modules are available at extra cost for the Drake R8,
Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.

General 2.2.sea
93K HC stack - Ham general test.

GRAYLINE.MAC.sea
70K HC Shows world grayline in real time.

HyperFT747GX.sea
250K HyperCard that will allow you to control your FT-747 via the
RS232
interface. This stack should be pretty easy to modify to work with
other
transceivers. It also now comes in a coloured version

Mac525B1.1.sea
100K HyperCard stack for controlling the JCR525 radio via the Mac's
RS232 port. Works pretty fast as the scripts are very well written.
Includes
Database of memories.

Mac5351.1.sea
100K HyperCard stack for controlling the JCR535 radio via the Mac's
RS232 port. Works pretty fast as the scripts are very well written.
Includes
Database of memories.

NOVICE 3.2.sea
128K HC stack - Ham novice test.

SSB.sea
500k With this one you can record your own voice, using MacRecorder
or
similar and then at the click of a mouse call CQ, QRZ, etc etc.

Tech 3.3.sea
108K HC stack - Ham tech test.

Trans.Stk v1.0.sea
32K A stack I made for transmission lines, giving attenuation, SWR,
etc

Various Logs.sea
200K Includes, FileMaker Log, 5K FileMaker IV document will provide
excellent general logging. HamLogger, 10K HC stack for logging
ham contacts - very nice. Logging Stacks UK, 100K Keeps all sorts of
logs. From contest, to local directory.

Logging Stacks USA, Same as above but with USA bandplans.
MacLogger, Very nice programme for checking contest entries.
SWL Logger Stack.

KQI Control v1.sea
53K Hypercard stack that will allow you to control a Kenwood TS-940S
via
it's RS-232 interface. However the author feels that it should work
with most
of the Kenwood range of transceivers.

Macnet rouster v 631
Worldwide database of Ham Macintosh users.

Mac To PC.

ZIP.sea
Will allow ZIP or PKZIP files to be exchanged between Macs and PCs.

You can try RadFax 0.9 which uses the microphone-input of the Mac as
AD-Converter. It's shareware ($25) and available via anonymous ftp.
I tried out the program on my Mac LC an LOWE HF 150 Reciever.
The picture resolution is satisfactory but the utilities of the program **
poor. However, you need not buy a Modem. *
Good Luck *

Good idea!

>Or would it make more sense to buy the KPC-3 now, and get something
>beyond the KPC-9612 when I actually know what I'm doing? :-)

No, get the 9612 since if you stay in packet, you'll want the 9600 capability otherwise the 9612 will bring a good price when you sell it later :-) .

> >> Also, can the KPC-9612 do HF packet?
>
> N3KFH> A resounding NO, comes to mind here. This is only good for
> N3KFH> vhf and above due to the modulating frequency shift size.
> N3KFH> It results in too large a bandwidth for use on hf bands...
>
>So what does it take to do HF packet?

This will probably start a flame, but so what. Why are you fascinated by HF packet? Are you really or do you want the other HF digital modes? HF packet is a joke at 300 baud (yes, I know about 1200 baud on 10 meters - maybe in another 7 years when the solar cycle picks up again). The few who are active on HF packet I have found are an unfriendly bunch who just want to pass traffic. Unless you intend to set up a BBS for a remote area I'd steer clear of HF packet.

If you really want to do HF packet buy a KPC-9612 and I'll trade you even for my Kantronics KAM.

3143. JNOS questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-15 17:05:31 UTC
From: rumbalj@govonca.gov.on.ca
Message-ID: <1994Sep15.170531.5685@govonca.gov.on.ca>
Source record: 47529

Thank you for reading this. I am just beginning to get my JNOS v1.10g station up and running here and I have a few things I'd like cleared up. If you can help me, please let me know.

1) What is the purpose of the NET.RC file?

2) What does a typical NET.RC file look like?

3) When I log into the mbox portion of the system from my console, and I post a message to a user at an AX.25 bbs system, where does the file go when I finish typing it and enter the /ex?? I use "L> user" but cannot get a listing of the file. Am I looking in the wrong place?

4) What determines the method of mbox message transfer (ax25 vs. smtp) that JNOS will use when transferring mail between two JNOS stations?

These things may be trivial to the experienced JNOS user, but to me they are puzzling. I have had experience as the sysop of an MSYS bbs a few years ago, but JNOS is totally new! Therefor, any help you can provide isappreciated.

>>the author.

Nope, Trumpet Winsock, (and all other winsocks I might add)
don't work with ARP to my Linux Box over Ethernet either. I'm looking
into this, but I suspect it's because Linux is not responding to the
ARP request for some reason. PC-NFS works fine doing ARP's, but
Winsock does not.

Since HAM ARP's are mapped to a callsign and winsock isn't
expecting this you will need to specify a gateway of some sort to go
from SLIP or Ethernet as the case may be to Packet/AX.25. When going
through a gateway you don't need to know the ARP of the receiving
machine. That's the job of the gateway.

>>
>> just checked my WS_FTP -- Play with the timeout value in the

>works on networks of any speed, including the terribly slow.

Well, that's fine and dandy, but how in the heck are you going
to map the IP address to the callsign/ethernet address. This is
required if you're on the same communications medium. And YES! A TCP
connection will timeout!

[Nonsense deleted for brevity. Probably stemmed from buffer overflow
of logical train of throught from brain to typing motor skills. Flow
control required but ignored.]

>
>There should be no reason why a properly implemented TCP/IP stack and
>applications set cannot run over packet radio at 1200 baud successfully.
>This goes for implementations on Unix, Windows, VMS, or whatever other
>OS you can name. One of these days perhaps I'll get to implement an
>AX.25 encapsulator for one of my company's router products!
>

1200bps is rather slow. Watch your timeouts... Also, running
the AX.25 TCP/IP stuff is going to be quite interesting between the
"vc" (virtual connection), and "dg" (datagram) modes. Running things
in (vc) mode will get you an ACK right away from the gateway and avoid
timeouts, but if the remote end is unreachable you'll run into
problems. Whereas (dg) will get you an ACK from the remote machine,
but you might timeout before it comes back to you.

In short, blow windows into the big bit bucket in the sky and
run Linux. Windows is just a big bandaid for DOS. winsock is another
bandaid. Now you put that many bandaids on a cut, or gouge without
changing them and you could wind up with an infection.

Here, watch this...

finger @ll.n2njh.ampr.org

[1:31pm] [~] 4 %
[1:31pm] [~] 4 %

This works... And it works flawlessly...

BTW, if you want the cheap way out, go out and get a PC with a
monochrome monitor, 256K RAM, and a floppy drive. This should cost
you about $75.00 or so. Then get 2 Ethernet cards. Another $40.00
each, and have the PC run KA9Q. Or you could do two serial interfaces
on the PC, one to the TNC, and another to the Windows (ahem)
"WorkStation" via SLIP.

Done deal.

Catch ya all later, I'm going to play LinuxDoom with another
ham over the radio...

No such thing as a stupid question.
JNOS is a TCP/IP operating system for amateurs. I think it was written by Johan (Hence the J) Reinalda, WG7J (Maybe thats the reason for the J) and a couple of other fellows. You can also work the x.25 protocol from this program. Good Luck.

From: dme@ingersoll.COM
Message-ID: <9409160005.AA22768@ingersoll.com>
Source record: 47539

Some advice after running JNOS here for quite some time:

-Free up as much memory as possible. DO load dos high.
You can use a utility like Quarterdeck's vidram to gain even more free memory.
The key that has worked for me is the more free memory the better.

-Have someone custom compile you a version with the features you need. The
pre-compiled versions probably have too much baggage compiled in.

These two suggestions have certainly worked for me here and others in the area.

JNOS 1.10G has been up steadily for days here under heavy load, with 3 radio
ports and an ethernet connection. It does work.

Good luck

DOS is just a poorly implemented Unix.

> applies to BIG machines like a VAX or HP 9000. Most people who only
> have access to small machines like a PC or Mac don't have this luxury.

Not so. We run SVr4 Unix on several 486 clones. These machines handle
50 telnet users and a heavy NFS load. They run weeks, sometimes months,
without a glitch. When they do go down, it is usually because we take
them down to modify something or install a new driver.

There's no reason why "most people" can't have this luxury too.

> Many of the Unix implementations don't have or use the MMU (memory
> management unit) which gives Unix this capability.

You are wrong on two counts. Modern Unix implementations on small
computers "do-so" use MMU hardware when available. But hardware support
of memory mapping is not the reason Unix is stable. Protected
addressing and the clear distintion between trusted kernel device driver
code and user code is the reason for the inherent stability of an OS.

>
> This is my current crusade. If you want an OS that DOES NOT let user
> jobs crash the OS it MUST HAVE an MMU.

No. It must have addressing exception handling and must prevent user
code from touching hardware. That's what you want.

> The bug, of course, is that the line shoule read:
> useful_function(&a_number). This code is guaranteed to write over
>
> 1) your code
> 2) your data
> 3) another process's code
> 4) another process's data
> 5) the OS
> 6) the interrupt vector table

Only 1 and 2 happen on my Intel 486 Unix SVr4 system. The other 4 are
"virtually" impossible.

Add all the entries you need to the domain.txt file then have stations add you as the name server (domain addserver hostname) and enable domain name servers (domain dns on). The stations will first try to find the IP address by looking in their own domain.txt file, then they'll try each donain name server if it isn't known locally.

>I am running version 1.08 under MSDOS.

FYI, the latest is JNOS 1.10g.

>station up and running here and I have a few things I'd like cleared up. If
>you can help me, please let me know.

>1) What is the purpose of the NET.RC file?

The net.rc file contains a list of sites, usernames and passwords that are used to automatically log you into FTP servers.

>2) What does a typical NET.RC file look like?

Typically you'll have a list of FTP sites that you visit regularly along with the username and password of that system. For example, my system is ke4dpx.ampr.org and I typically type 'ftp ke4dpx' to get to my own system. I also regularly connect to k4dmu.ampr.org by typing 'ftp k4dmu'. So the two entries in my net.rc file are:

ke4dpx ke4dpx password
k4dmu ke4dpx password

>3) When I log into the mbox portion of the system from my console, and I
> post a message to a user at an AX.25 bbs system, where does the file
> go when I finish typing it and enter the /ex?? I use "L> user" but
> cannot get a listing of the file. Am I looking in the wrong place?

This is one of the most confusing aspects of NOS, or so it seems. Most people are used to F6FBB and its idea of 'one size fits all' message system (Ick!). NOS uses a folder-type system for messages so messages to me are stored in the ke4dpx folder, messages to Dean are stored in the kb7qdi folder, messages to Bruce are in the kd4uld folder, etc.

To check messages in a folder, type a followed by the name of the folder. For example, 'a ke4dpx' puts me in my personal folder. Note that these are personal folders so only the receiver and the sysop have access to them.

You can also have public folders that anyone can get to. Public folders are specified in the /spool/areas file by including the name of the folder (8 characters max) followed by a description. For example, on my system I have all, clubs, tcpip, and newsline folders so my /spool/areas file looks like this:

all General chit-chat
clubs Amateur Radio Clubs
newsline Amateur Radio Newsline
tcpip General TCP/IP and NOS messages

Type a by itself to see a list of public folders, or af to see the list with the descriptions.

>4) What determines the method of mbox message transfer (ax25 vs. smtp)
> that JNOS will use when transferring mail between two JNOS stations?

This is determined by a combination of the /domain.txt file the /spool/forward.bbs file, and the /spool/rewrite file. By default if you have an IP address for someone in the /domain.txt file, mail to that person is sent directly to him via SMTP. For example, Joe K4DMU runs a NOS station locally so I have an entry for him in my domain.txt file:

k4dmu.ampr.org. IN A 44.106.56.201

When I send mail to Joe, NOS automatically connects to him and puts the mail on his system via SMTP. Other mail must be handled with the /spool/rewrite file. This file basically tells the system how to deal with and where to put mail to unknown systems. This file also gets to be rather complicated, but an easy solution is to have one entry for each person. For example, I regularly send mail to Dean KB7QDI and that mail is put into a mail folder on my system. The entry in spool/rewrite that handles this is:

kb7qdi@* kb7qdi

Thus I can send mail to kb7qdi, kb7qdi@wi9p, kb7qdi@wi9p.#ncky.ky.usa.noam, etc. and it still goes in the local kb7qdi folder.

> These things may be trivial to the experienced JNOS user, but to me they
>are puzzling. I have had experience as the sysop of an MSYS bbs a few years
>ago, but JNOS is totally new! Therefor, any help you can provide
>isappreciated.

I strongly recommend you pick up a copy and read *NOSintro* for more detailed information. This book is available from the ARRL an is an excellent introductory text for NOS. It does go into quite a bit of detail on mail forwarding, routing, etc.

Has anyone got a MAXON 4020N UHF txer working on 9600?

Sponsored by the Midlands AX25 Packet Group (MAXPAK) I've now converted 3
4020N's for 9k6.

Quick answer:
Change the 2 21.4 8KHz filters to 15KHz (21M15 type)
Change the 455 filter to a CFW455E
Rx Audio from pin 10 MC3359
Tx Audio to junction R16/R17, .85 V p/p (could vary with different xtals)
Adjust T1,T2 for best eye pattern

Long answer:
Mail me for (18K) paper on Maxon 4020 (and also MAXPAK's G3RUH clone board).
Mail RICHARD@g1nzz.demon.co.uk for details of the MAXPAK board.

3160. NET_Mac2.3.44.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-16 11:03:59 UTC
From: adam@iag.TNO.NL
Message-ID: <9409161003.AA08125@iag.tno.nl>
Source record: 47456

The Netherlands, September 16, 1994.
Hello dear reader,

Today I distributed NET_Mac2.3.44.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Save some space in 'ax heard' output
- Display transmissiontime and -speed at the end of an ftp get/put
- Let UDP report 'port unreachable'... TRACEROUTE needs that...
- Inform us about an AppleTalk/ethernet gateway if one is present indeed
- The NET/Mac versionnumber will now be recorded in TRACE-files correctly

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

Kind regards,

Adam PA2AGA (e-mail: adam@iag.tno.nl)
(or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

>I'd steer clear of HF packet.

If you tried to break in to a HF CW or voice traffic net and chat, would you expect to be met with open arms by the traffic handlers? Why do you expect it to be different with the HF packet net operators? You *can* do realtime random packet operation on HF, but that's not it's strong suit. In fact, I'd say that if random realtime chatting is your goal, then packet is not for you, HF, VHF, UHF, or microwave. It simply isn't suited to that use. Packet is structured to transfer bulk non-realtime information. If you want realtime chatting, try voice modes.

N3KFH> vhf and above due to the modulating frequency shift size.
N3KFH> It results in too large a bandwidth for use on hf bands...
>> So what does it take to do HF packet?

KO4LW> This will probably start a flame, but so what. Why are you
KO4LW> fascinated by HF packet? Are you really or do you want the

Basically because I've been considering getting an HF rig, and haven't had much luck with voice modes so far. The local repeaters tend to be gathering grounds primarily for people who already know each other, and while they aren't actively unfriendly to newcomers, don't go out of their way to respond/welcome them. And I can't get to know them through the clubs since they are on nights I'm unavailable.

I was also curious. I knew HF packet existed, just didn't have many details about it. What it took to run it, etc.

Bob

I don't remember the FTP sites that carry Linux, but another alternative is
to pick up a copy of the Slackware Linux CD-ROM -- assuming you have a
CD-ROM drive, of course. I find the CD much easier since it has everything
in one place and it's ready to run right out of the box.

Sure! Linux is great! Works on 386sx or better, 4meg minimum (well, 2meg
but you can't really do anything with that:-). with that configuration,
you will be able to even run XWindow if you have enough swap disk space. The
kernel AX.25 extensions are fantastic IMHO. Look on group
comp.os.linux.announce for the new phone number and address of InfoMagic,
they will sell you a CD-ROM (double disk set) for $25, or ftp to
ftp.cdrom.com and look for the slackware linux distribution v2.0 (arround
about 80Meg.)

Is there anyone out there who uses a "mac" for their packet station.
I need recommendations for software and hardware. Any comments about
the best equipment or personal experiences would be greatly
appreciated.

There's a distribution list for wnos users. Based on the last message
from wnos-L, the wnos4beta0 release seems to be more stable.

I am interested in an internet <=> packet gateway facility. I don't have
packet here in the UK, but I'd like to send traffic from my internet account to
the packet system in vk. The aim is to send packet traffic to friends of mine
there - as it would be just me as vk2eng (as, based on the sentiments expressed
in the above, g0vey would not be able to accomplish such a feat!) I cannot see
the difficulty. After all, if I access a gateway in vk then the packet signals
will only ever go to air there. Has anyone successfully done this in the past
- if so, how?

hello, We are here several amateurs here
in Iceland that are very interested in
higher data rates in packet radio.
We have been using 1200bps for many years
and 9k6 is under way. But we want something
faster like 56kbps.

But how??

Are there any "off-the-shelve" kits??

We have heard of something called
"56kbps on a pc-slot-card" witch has
the radio and the modem on a single pc-slot

If you have any info, experience or anything
to say.

"how-you-did-it" tales are most appreciated.

please e-mail.

tnx in advance

The 9612 has an FSK (Frequency Shift Keying) modem in it, which is what all terrestrial stations use, as well as _some_ pacsats. Some other pacsats use PSK (Phase Shift Keying). The KPC-9612 does not have a modem disconnect header feature, so you cannot add a PSK modem to the KPC-9612 to connect to these pacsats. I'm hoping a future version of the KPC-9612 will fix this.

The AEA PK-96, however, does allow you to connect a PSK modem to it, and should be "compatible" with all the pacsats.

The addess to FTP to is ftp.indirect.com
Directory is: pub/software/msdos/hamradio/xpware

It is a trial version. You are allowed 100 uses. I kinda like having HF/VHF
windows open and some of the other features are nice.

It is intuative but also takes some playing around with. BTW, I think it
leaves your TNC in the HOST/KISS mode in that my other TNC programs now just
show garbage characters. (I need to correct this).

Good luck! Let me know what you think of it.

I use a PK 96, have good things to say!,

1) It has a nice interface, easy to use with any modem software of your choice.

2) Has a button on the back for hard reset if you ever need it!

3) Getting in and out of Kiss mode for JNOS is the easiest I have ever seen
(compared to a Kantronics KPC3).

Just started using it for 9600 baud on 440 and it seems to be working great! I
like it and I would not have any problem recommending it to anyone! If you
have any particlular questions please ask!

Message-ID: <kb5rtk.79.2E7CF9A1@rt66.com>
Source record: 47479

Hello Hams,

I use Jnos and I was wondering if anyone would know how to use netrom routing through a bbq switch? I am on 440 at 9600 baud and my father is on 2m and there is a bbq (I think that is what it is called) switch that uses netrom for bbs forwarding. What I want to do its to send smtp mail through the bbq switch from 440 to 2m. The major problem is that this station here in Albuqerque has no IP address so I can not Ping or address it through him to my father (Can I?)!

Thanks for the info!

SB TAPR @ ALLUS $TAPR916.001
NEWS: Nominations Sought for TAPR Board of Directors

Please use BID: $TAPR916.001

Tucson Amateur Packet Radio 9/16/94

TAPR is governed by a 9-member Board of Directors. Each member of
the Board serves a three year term. Three positions are up for
election.

Board members are expected to attend the annual Board meeting
held in conjunction with the annual meeting. They participate
in the decision-making process and provide guidance to the
officers. They receive no pay and must defray their own
expenses to attend meetings. Board members should be prepared
to be active in the continuing Board deliberations, which are
conducted via the Internet. Active participation in TAPR
activities by Board members is important to the furtherance of
the objectives of TAPR. The officers of TAPR are elected by the
members of the Board at the annual Board of Directors meeting.

To place a person in nomination, please remember that he or she must be
a member of TAPR. Confirm that the individual is willing to have their name
placed in nomination. Send that person's name (or your own if you wish to
nominate yourself) along with your call and their call, telephone numbers,
mailing address, and Internet address. The person nominated should submit a
short biographical sketch to be published along with the ballot.

Nominations and biographical sketches should be submitted to the TAPR
office no later than December 10th, 1994.

More details may be obtained by contacting headquarters:

SB TAPR @ TAPR $TAPR916.002
NEWS: TAPR 1995 Annual Meeting

Please use BID: $TAPR916.002

Tucson Amateur Packet Radio September 16th, 1994

TAPR 1995 Annual Meeting, March 3rd, 4th, & 5th

TAPR 1995 Annual Meeting

March 3rd, 4th, & 5th, in St. Louis, Mo.
Hosted by MoAmPS (Missouri Amateur Packet Society)

Join some of the brightest and most enthusiastic of today's packet developers/users, with a weekend full of Packet Radio and Digital Communications talks, presentations, SIG meetings, and two SPECIAL Sunday Workshops. In addition an advanced DSP symposium is planned for Friday afternoon and evening for software developers of DSP systems.

TAPR (Tucson Amateur Packet Radio), a non-profit research and development corporation, works on the advancement of digital communications and education. This year's annual meeting will be the first held outside of Arizona and presents a unique opportunity for those unable to travel to Tucson to attend meetings.

An advanced DSP (digital signal processing) symposium will be held Friday, March 3rd. This is for those working with DSP technology currently, and not a session for introductory topics.

The annual meeting formally begins Saturday morning with presentations and papers, as well as discussion on other projects of interest throughout the day. Issues concerning packet networking and BBS operation are also anticipated. A banquet will be held Saturday evening and will include a prize drawing. After dinner, Special Interest Groups will meet and discuss issues.

On Sunday, two workshops will be held. One will focus on Error Correction Techniques, by Phil Karn, KA9Q, while the second will focus on development of software/hardware for the TAPR/AMSAT DSP-93, by Bob Stricklin, N5BRG, and Frank Perkins, WB5IPM.

These are exciting times for digital communications and TAPR. This year's meeting should be a super-charging event for everyone who can attend!

Call for Papers
Papers are welcome from everyone. Although there is limited time during the weekend, all attempts will be made to allow those present to talk. Deadline for submission of papers is Monday, February 7th, 1995. Contact the TAPR office to request an author's information package.

Meeting Place and Hotel
The TAPR Annual Meeting presentations, meetings, and workshops, will be held at the St. Louis Community College at Florissant Valley. Lodging will be at the Henry VIII Hotel and Conference Center, 4690 North Lindberg Blvd, St. Louis (Bridgeton), MO, 63044, Phone (lots of them): 800-325-1588, 800-392-1660 (in MO. only), 314 731-3040, or FAX 314 731-4210. Rooms rates are reasonable. It is approximately 4 miles west of St Louis Lambert Airport with shuttle service and approximately 10 miles (all freeway) from the college. A block of 50 rooms will be held until February 4th, at which time those rooms will be released for general booking. If you are planning to stay at the hotel, it is highly recommended that you book your room prior to February 4th, 1994.

For full details on Registration and Workshops contact TAPR.

SB TAPR @ TAPR $TAPR916.003
NEWS: TAPR HF SIG Formed

Please use BID: $TAPR916.003

Tucson Amateur Packet Radio September 16th, 1994

Introduction of the TAPR HF Special Interest Group

Objectives for the HFSIG

The purpose of the HF SIG is to serve as a forum for those involved in experimenting, and developing digital applications for HF.

Background

HF offers unique challenges and rewarding opportunities for amateur radio - it allows for both short and long distance digital communications without the involvement of specialized terrestrial or space-based equipment such as repeaters, or satellite transponders. It allows for one-to-one (keyboard-to-keyboard), as well as many-to-one (networking), modes of operation. These are quite different in philosophy and functional needs.

The amateur bands have seen a dramatic increase in diversity in technology as well as increased activity in the use of digital modes. This is due mostly to the availability of TNCs and application of personal computers. Basic technology, however, has not changed much since the 60's and is in great need for innovation to meet future challenges.

Development of future technology for HF digital requires experimentation with several topics on communications such as:

1. Bandwidth-efficient modulation schemes, i.e. for increased robustness, speed, and usability. These include various forms of m-ary FSK, m-ary PSK, or QAM using single or multiple carriers. However, other technologies such as spread-spectrum communications also need to be explored.

2. Application of coding theory for error detection and correction for increased reliability. This will require the use of block and/or convolutional codes.

3. Protocols to suit new proposed modulation and coding schemes. Various forms of ARQ and FEC are possible. The possibilities for half and full duplex modes need to be explored.

In addition, development platforms for such experimental work will most certainly receive attention.

4. Programmable DSP platforms. Hardware, and software for application development.

5. Host-based software. Typically this includes low-level I/O, CUA/SAA compliant user-interface development, but also a user-contributed software repository for commonly-used algorithms such as frame synchronization, channel equalization, scrambler polynomials, fast CRC calculations, various error-detection/correction algorithms such as Golay (24,12), Reed-Solomon, and trellis/Viterbi codes for example.

Getting involved

We require talents representing a wide range of topics such as mathematics (coding theory, signals and transforms), software engineering (algorithm development, real-time OS, low-level I/O, host OS), electrical engineering (analog, digital and RF), digital signal processing (theoretical, hardware and software), etc. However, there also is a similar need for technical writers, beta testers, and project management.

It is unlikely that this type of experimental work will be using any existing TNC hardware. A general-purpose programmable DSP platform, such as the TAPR DSP-93, a DSP-based sound card, or equivalent would be required as well as a fairly fast 386/486 or equivalent host computer for high-level software development.

Besides development efforts, there will be ongoing on-the-air testing to establish how well theoretical ideas are working in practice. It is envisaged that there would be rapid evolution of modulation and protocol development and thus the need for fully programmable hardware.

This introductory note is probably incomplete, however, it presents some perspective and direction for the HFSIG. I would appreciate further suggestions and feedback.

You might want to take a look in the documentation and see if there is an
option to control this. I don't know anything about xpkam, but I'm the
author of another shareware host mode terminal program, KAMterm, and I set
it up to give the user a choice on this. By default, KAMterm prefers to
leave the TNC in normal mode (if you try to exit in host mode, it asks if
you want to reset the TNC first). If you add a certain option in the
config file, KAMterm silently exits with the TNC in host mode. I'd bet
that xpkam does the same thing (but its defaults appear to be different).

If that doesn't work out, you can always key in the reset sequence. I'm
not sure off-hand what it is, and have to get ready for work now, but it's
in the host mode documentation in the Kantronics Operation Manual. They
specifically mention what you need to key in (from a non-host-mode terminal
program) when your TNC is accidentally left in host mode.

Hope this helps. Later,
--jim

Message-ID: <35k49n$81f@thecourier.cims.nyu.edu>
Source record: 47393

Hi everyone.. two part question. First, we saw this:

|> 3) Getting in and out of Kiss mode for JNOS is the easiest I have ever seen
|> (compared to a Kantronics KPC3).

and I remembered that my TNC refused to leave KISS mode last night. I left the machine on running JNOS110g for over 11 hours yesterday, hoping to find any ax.25 activity. When I finished, the TNC would not accept HOST OFF 3 <ctrl-c's>. I have an internal card, a PCB-88, and now it's stuck. Any hints on getting out of KISS mode short of removing the card and reinstalling it? It's still working because lines are still pouring in whenever I power up the scanner.

Secondly, is ANYONE running 1200 baud ax.25 in the New York Metro area? My ticket hasn't come yet, so I can only monitor the airwaves. I attached the KISS TNC to the session and hport'ed it, yet after 11 and a half hours of monitoring 15 1200 baud packet frequencies, I found exactly 0 ax.25 transmissions. 'ax25 heard' actually revealed zero.

Is the entire region running 9600 baud ax.25? I'm close to Union, Cranford, and Elizabeth, NJ but can reliably copy 1200 baud packet from as far as midtown and Staten Island with my factory whip.

Is it enough to 'attach', 'hport', and 'ax25 heard' or do I need to do more? Looks like I better pick up NOSIntro from the ARRL.

Many thanks.

3197. rules of content

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-19 13:58:22 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <35k5du$8es@thecourier.cims.nyu.edu>
Source record: 47392

Are there any grey areas of the rules of content? I
understand compression and uuencoding have been deemed
not illegal as means of encryption. Suppose I use a
home computer as my own personal FidoNet gateway. I'll
login to the machine via packet from my laptop, the
machine will get a QWK packet for me, uuencode it (since
it's already compressed by nature), and FTP it to my
laptop while I'm on the road. Then I'll disconnect from
my home machine and use an offline reader to read my messages.

What if there's foul language in some of the message areas?

Would it make good sense to write a routine to uncompress
the packets and replace all bad words with stars before
recompressing, uuencoding, and FTP'ing the file?

Suppose I design my own compression algorithm? If no one
else uses it, does that qualify it as encryption? How
would I prove otherwise?

The questions mount as I await my ticket..

3198. Re: Radio Data System

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-19 14:13:50 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <35k6au$8es@thecourier.cims.nyu.edu>
Source record: 47394

Perhaps you mean the RDBS, the Radio Data Broadcast
System?

Radio stations can add a subcarrier data transmission
system for $2.5k which sends data alongside the audio.
Car and home stereo systems will be able to show the
user such things as the call letters of the station, the
format, traffic information, or the song currently playing.

Also in the works is a method by which a radio station can
force your radio to retune in order to either receive the
same syndicated program (as you drive through markets) or
receive emergency information such as approaching damaging
weather or an earthquake. You could also select from a group
of radio stations that identify themselves by format, allowing
you to skip Frank Sinatra when you're looking for the Sex Pistols.

For the U.S. listener, it could mean the end of the Emergency
Broadcast System, since the data feed could force the radio
to test it's retuning circuitry and notify the user if it will
fail in the event of a real emergency.

There are a few RDBS stations in operation already, and
RDBS-ready radios are supposed to only cost one or two
hundred US dollars more than high end units already do.

3200. IM_Mac1.0b28c.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-19 14:45:19 UTC
From: adam@iag.TNO.NL
Message-ID: <9409191345.AA29133@iag.tno.nl>
Source record: 47486

```
=20
Release Notes - IM/Mac 1.0b28c

- Improved internal memory management.

- The timer task was not removed from the system queue when IM/Mac
had to quit because of an out of memory situation.

- Improved MacsBug detection algorythm. The old way did not work
correctly on 32-bit systems.

- Added watch cursor in 'Save As=C9'.

- The name of the crash log file is changed from 'crash_log' to
'StdLog' to be consistent with MacsBug 6.5.

- Thighter check for 'special' addresses.

- Brought icons back in line with NET/Mac.

- Added 'Hide Clipboard'.

- Added 'kind' resource.

- Added a 'snd ' resource (Triangle).

- Changed 'New' into 'New Message'.

- To reduce file fragmentation and improve I/O performance 'Save',
'Save As=C9', 'Save Selection=C9' and 'Append=C9' preallocate the
required number of blocks.

- Cancel printing was implemented since long but it never worked. It
does now.

- Added 'in' (inch) after the values in the page margin boxes. You
cannot change this to centimeters nor does IM/Mac honor the
setting of the 'Numbers' control panel.

- Missing help balloon text for 'Page Setup' dialog added.

- Added 'Collated Copies' and 'Print Selection Only' checkboxes.
Both are inactive for the moment.

- Corrected typing error in the text of alerts 466 and 467.

- A 'From: ' line as in 'From: aaaa bbbbb <xxxxx@yyyyyyyyy.zzz>' was
not correctly interpreted. 'aaaa' was taken as the address while
it should have been 'xxxxx@yyyyyyyyy.zzz'. This resulted in a
search for the wrong data in the 'alias' file when replying.
```

- Changed 'X-Mailer: IM/Mac 1.0b28c' into 'X-Mailer: IM/Mac [version 1.0b28c]'.

- Changed 'Date: Sat, 17 Sep 94 09:53:59 +0000 UTC' into 'Date: Sat, 17 Sep 94 09:53:59 +0000 (UTC)'.

- 'Clear All' sometimes left two carets.

Sunday, September 18, 1994 - 07:56:51 UTC

PS (by PA2AGA)

This version obsoletes all versions of info-mac/comm/radio-im-mac in the Sumex-Aim archives.

The new IM/Mac has (hopefully) been uploaded to oak.oakland.edu, to the directory /pub/hamradio/mac/digital and to ftp.ucsd.edu, to direc=
tory
/hamradio/packet/tcpip/incoming. If it's not there (anymore), then lo=
ok
at /hamradio/packet/tcpip/mac.

Date: 1994-09-19 17:50:13 UTC
From: "John L. Schweiger" <lurker@umich.edu>
Message-ID: <35kj0l$saj@lastactionhero.rs.itd.umich.edu>
Source record: 47489

I'm attempting to interface an MFJ-1274 TNC to an Alinco DR-1200H radio.
The TNC has a 9600 baud modem which is working correctly, the problem is
when I switch to the 1200 baud modem. Even with the pot set at maximium
the audio drive to the varactor is too low for the signal to be decoded
by the receiving radio. I've seen references about this audio level for
other TNC's but I'm at a loss as to a way to increase the audio output
for my 1274. Anyone familiar with a way to this? Thanks in advance!

> the difficulty. After all, if I access a gateway in vk then the packet signals
> will only ever go to air there. Has anyone successfully done this in the past
> - if so, how?

If you send a message to the sysop of vk2xlz.ampr.org, and get
registered there, you can telnet out directly to him, and then out on a
radio port. I know its possible, I dont use it, but a couple of friends
have accounts, and send traffic this way to VK.....

What I ment about the UK regs was it is (theoretically) not illegal to
go from PACKET to INTERNET, but it is the other way around. Reason =
NON AMATEUR TRAFFIC MUST NOT PASS ACROSS THE RADIO SYSTEM.

Even though I could theoretically send a message from G7OBS @ GB7DAA
(me) to mike @ imcldn.demon.co.uk (me), I dont think I could send a
reply, because the address mike @ imcldn.demon.co.uk is not a valid
'amateur address' (wonders if g7obs @ imcldn.demon.co.uk would be
acceptable.....)

Jon> email. He is also looking for a fiel that lists call signs
Jon> on a Mac.

Yes, there are (there should be an FAQ floating around listing Ham
packages for the Mac, although chances are all he will need is to have
is a terminal program to connect to a local BBS.

Jon> And for me can you tell me the the proper Internet path to
Jon> send a email over the packet system to a packet user?

There are a couple different gateways, details of which escape me for
the moment. If you're a ham operator, it shouldn't be a problem,
otherwise every message will have to be read (since it's 3rd-party
traffic).

3206. JNOS, Questions about operation/capabilities

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-19 19:30:10 UTC
From: feistjf@nisewest.nosc.mil
Message-ID: <1994Sep19.193010.16240@nosc.mil>
Source record: 47386

Maybe someone would be kind enough to enlighten me on some of the current jnos operations and capabilities. Currently I am running an FBB bbs which is connected, via ethernet, to a Novel server. Once a day the fbb system exports messages to the server for uploading to the satellite. Often several messages are appended to a single file. Does jnos have this capability? I want to take advantage of Netwares TCPIP abilities. Can jnos support CD-ROM drives for user access? Or better yet will jnos run under OS2?

Any constructive ideas are welcome.

Yep, and then 'add domain addserver ucsd.edu' on the gateway machine so
that anything the gateway can't resolve will force a DNS request to the
authorative server for AMPRNet (make sure you allow DNS traffic to this
host in your access.rc list).

> >I am running version 1.08 under MSDOS.

And what nice stable code it is too. Its been running on the Wollongong
Gateway for over two weeks now without problems - admittedly we didn't
compile in NET/ROM support - we've found leaving out NET/ROM adds
CONSIDERABLY to the stability of the box.

In XPKAM the TNC is left in HOST mode upon program exit by default.
This can be changed by adding the following line to the
"shutdown.par" file.

INTFACE TERM

THIS MUST BE THE LAST LINE IN THE FILE!!!

This will place the TNC back into command mode.

: Well Im not infavour of this..
: what ever happend to CQ CQ CQ and tuning about ??
: Now with Internet connect and DX Clusters You can simply
: go to a DX spot connect on the Internet join the DX cluster
: Announce to All Im on 14.045 or 28.675 what ever
: And setup the skeds.
: What a Cheet Hi Hi..
: Ill try it next time im on St.Kilda VR18g and Op on 144 or 432Mhz.
: Barry GM8SAU/DC0HK..

I'm certainly in favor of the 'real DX' mode - my point is why are we
cluttering up huge amounts of RF real estate forwarding those spots
up and down the planet when you could use internet tunnelling to get
it done faster, farther, and without jamming up half a billion vhf/uhf
simplex frequencies. I like the phone suggestion - unfortunately I'm
a lowly coded tech and can't participate.

From: etjfonte@ci.ua.pt
Message-ID: <CwFxsv.sH@news.ci.ua.pt>
Source record: 47399

Hi , Hello everyone ...
I'm using and home-made BAYCOM modem and using the BAYCOM V.1.5 software.
I saw some postings and I see that a new version it's out (V1.6).
Can anyone tell where I can get it...
I also have the TFPCX 2.10 version (KISSINI and TFPCX) but I don't know
how to use it.
I have the TPK V1.64a and before running it I execute TFPCX -PCOM1
because I'm using COM1 , and when I start TPK he does not work (he stops on
the first image , TPK version ....)What should I do , run KISSINIT or have
I done anything wrong ???? BTW here can I get the TPK V1.81 Version. ???
The last question (at least !!!) I've also the YAPP program , can I run it
with baycom modem ??? (Can I xfer programs in YAPP bin protocol ?)
Any help would be fine.TNX
PSE answer by email or follow up to my posting.

I want to add a bit to this that I haven't seen come up on this group yet.
Although PGP encryption is clearly prohibited it seems that it would be legit
to apply a PGP signature to any type of message. Is this correct logic?

One day since my license arrived, two more days 'til my HT arrives!

Try anonymous FTP to ftp.eos.ncsu.edu and look in /pub/tandy100.
There's lots of Model 100 software there. There is also a
computer bulletin board called Club 100 in California that you
might want to investigate. If you find any other good stuff,
please let me know.

References: <35k6au$8es@thecourier.cims.nyu.edu>

SJ> Perhaps you mean the RDBS, the Radio Data Broadcast
SJ> System?

RDS is the original system developed in Europe and used in many countries - probably everywhere except the USA !

How does RBDS differ from RDS - the only difference that I can see from the description is that the options you mention as being "in the works" are already available and in use with RDS.

The whole of the BBC network has had RDS for some time, and most of the main commercial radio stations carry it. I can drive from here in the North of Scotland to south of England and not have to retune my car radio. During that time, it can retune to a nearby Local Radio station if there is a Traffic News announcement. When I reach my destination I can retune immediately to another of the national networks - the frequency will have been loaded into the car radio everytime it retunes on the network that I am listening to (Enhanced Other Networks).

Experiments are taking place at present where the Traffic News is put out in coded form - so that it can be heard in other languages if required.

-> Hello Hams,
->
-> I use Jnos and I was wondering if anyone would know how to use n
-> routing through a bbq switch? I am on 440 at 9600 baud and my father
-> 2m and there is a bbq (I think that is what it is called) switch that
-> netrom for bbs forwarding. What I want to do its to send smtp mail t
-> the bbq switch from 440 to 2m. The major problem is that this statio
-> Albuqerque has no IP address so I can not Ping or address it through
-> father (Can I?)!

You can't ping it, but you may want to hop-check it by sniffing out
the route step by step. Then set up a NETROM connect over to your
father once you know the path. I believe that JNOS has some limitations
with the number of connect strings you can specify....so you may have
some long haul connects...

Date: 1994-09-22 01:56:20 UTC
From: nich@wam.umd.edu
Message-ID: <35qo84$pf8@cville-srv.wam.umd.edu>
Source record: 47432

Hi there,

Execuse me if I post this message in the wrong group. If that
is the case, can someone point to the right group for me?

Basically, I would appreciate if someone can inform me about
any commercial use of packet radio. Is there any existing commercial
packet radio network? How can I utilize it to pass data to a remote
place where the cost of any other means is relatively high?

Thank you very much for your suggestions.

Nick

W2XO MAINTAINS A GATEWAY BETWEEN INTERNET AND PACKET. To mail
from internet to packet:
1. Mail to: "bbs@w2xo.pgh.pa.us"
2. Make the first line of the text a Packet BBS "send" command,
ie:

SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the internet mail becomes the "title"
line of the packet BBS mail.

Any problems just send msg to W2XO Jim Durham

|> Try ax25 hsize (number of entries in the heard list)

okay.. I'll try that.

|> You should be able to monitor packets live if there are any there.

that's what I would think, but when I switch back to my telecom
software, the TNC had been queueing up the data for the previous
few minutes, and it flies by as soon as my telecom sw connects to it.

|> Try trace (port designation) 111 or 1111 and have a look at what is going by.

okay, I've been doing trace 0111, but not 1111.. I'll give that a shot too.

Any ideas as to why my core memory drops to near zero but the software
isn't pulling data from the TNC?

It could be that I happen to exit JNOS just before a huge data burst,
so I'll have to check that one for sure.

I *really* want to learn the ins and outs of packet TCP/IP before
I get on the air so I don't screw anything up in my area when my
ticket arrives.

3241. kamterm tnc software for Kantronics KAM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-22 14:58:56 UTC
From: eckman@eos1.larc.nasa.gov
Message-ID: <35s63g$4ae@reznor.larc.nasa.gov>
Source record: 47423

Quite sometime back I briefly used a shareware software package
called kamterm which, as the name implies, controlled a Kantronics
KAM. I recently have been looking for the package on the
usual anonymous ftp ham radio software sites, but can't
seem to find it anywhere. An 'archie' search also came
up with nothing.
Does anyone know if this software is still available from an
internet site? Thanks for any information.

3242. passive bulletin distribution

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-22 15:17:37 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <35s76h$c30@thecourier.cims.nyu.edu>
Source record: 47429

Question re: bulletin distribution

First, I presume that a main BBS distributes bulletins to
other BBSes in its area. Suppose a distributor has five
or six BBSes to distribute to. Could bandwidth be saved
if, while the distributor is sending the bulletin to one recipient,
the other five listen in and store the bulletins for themselves?
That way, when the distributor connects to the next machine,
it could send a table of contents and await a reply from
the intended recipient indicating the bulletins it
has not received to date.

Basically, since I'm an RO station, I'd like to leave my
machine on all day and capture all the bulletins as they
are transferred on a network backbone. Then, I can read
them when I get home. Or better yet, read them on a
(physically) networked machine so I won't disturb the
ongoing receipt of bulletins.

Comments?

3244. JNOS on Linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-22 17:30:37 UTC
From: jwl@walter
Message-ID: <1994Sep22.123037.1367@walter.cray.com>
Source record: 47435

First, I've been told my newsreader is generating a bad reply to line,
so if you email me, please use jwl@cray.com. Sorry for the inconvienence.

I have recently installed JNOS on my Linux 1.0.9 system and find that
the function keys do nothing other than print a capital A for F1,
B for F2, etc. I understand from reading the various and assorted
manuals that the function keys are suppose to do other things. Especially
the F10 key. Is there something fundamental that I am missing, like
a configuration file?

According to the dos with the port, the fkey (?) function hasn't been
implemented so I can't reassign the functions to something else.

Also has anyone had any success with running JNOS under X? Seems
that the keyboard problem is even more complicated by the convoluted way
X gets in the way.

Thanks for any comments.

Jim.

There are several. Ardis is owned by Motorola and IBM (or was- think IBM bailed out). Ardis is the network behind the neat handheld terminals that IBM servicepersons carried around. RAM Mobile Data is another. There is also a new entrant- Metricom and their Richochet Microcellular Network. They're the most promising for the casual user- they use the 900 MHz band, access is cheap.

Metricom is in Los Gatos, CA. I don't have any pointers for RAM or Ardis.

Does anyone knows any mods for the kenwood TM-201 A.

There are a copple of diodes near the processor, it looks
like a matrix, but when cut nothing happens.

Mike van Rossum PD0NXT

This is my first posting, so if i did something wrong, sorry.

3256. JNOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-23 13:49:20 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <35umd0$pod@thecourier.cims.nyu.edu>
Source record: 47348

Two things.. I've been working on setting up JNOS and had some questions. I stumbled across a digest version of this group at sunsite.unc.edu:/pub/academic/agriculture/agronomy/ham/DIGITAL

don't ask me about the path, that's where it is. FTP each of the files and you can view them with any UNIX-type mailreader (and there are DOS-based UNIX mail readers). I printed out about seven messages dating back to June of this year where people here answered the same questions I have now when someone else asked them months ago.. you might find help, too.

And secondly, I think I found out what was wrong with my TNC. The user guide says to exit KISS mode by entering "host off" followed by 3 control c's. AEA tech support said 3 control c's. In a message I printed from the digest, someone mentioned the importance of hitting the 3 control c's and *waiting a full second* for command mode to return. That did it for me. However, later on, my input buffer filled in the TNC, and the TNC locked. I had to power down and kill the battery backup in the TNC.

Thanks, sunsite, for digesting this stuff.

I don't think Lan-Link can be called pd. It was shareware the last time
I looked. Take a look at my freeware (TM) package, SimpTerm. It
can be found in /SimTel/msdos/hamradio as simptr21.zip. It is generic
and will run on most of the popular TNCs on the market. It doesn't cost
you anything and you can sleep nights without worrying about beating
out that shareware author of a buck!

Jim.

This is precisely my point and is the reason I was inquiring why this newbie was interested in HF packet to begin with. HF packet really does have only one widely used purpose - Traffic handling (of whatever sort). When I was a newbie (not so long ago) I did not know this, however, it did not take long to find out. When I look back I would have been better off not buying the equipment I did. I did not intend so much to bash the HF packet crowd with my posting as to get this guy to ask himself what it is that he wants to do as a ham and maybe save him some bucks along the way by not buying features that he will never use.

You can get the ax.25 protocol in ascii from the arrl infoserver.
I just did this, by coincidence, today.
To get it, send e-mail to info@arrl.org
In the body of the message, put, on separate lines:

send ax25-1.doc
send ax25-2.doc
quit

and you'll get a reply in a few minutes.

You can get more information about the server by including these
lines (above the "quit" line):

help
index

This stuff is also available via ftp from them, I think, but I don't know their
location.

3264. Baudot RTTY terminal emulator?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-23 23:25:21 UTC
From: terry@venus.sunquest.com
Message-ID: <35vo51$4s0@odin.sunquest.com>
Source record: 47354

I'm asking this question for an acquaintance - I am not personally well-versed in the ham digital world. (I'm just a plain ol' country UNIX hacker ...).

He's looking for a terminal emulator to run with Baudot RTTY (on a TRS-80 model 4). He's fairly certain that some such thing exists - he says that gobs and gobs of hams used TRS-80s to drive RTTY at one time, and that Baudot was fairly common.

Now this leaves *me* with lots of questions, which he did not seem to me to be knowledgeable enough to answer. But to start with, I'd appreciate mail from somebody who might understand from this sketchy description what it is that he wants, or know what software he might be after.

(I don't think a terminal emulator is actually what he wants (though maybe it is); I think all he needs is software to grab lines of input from the keyboard, translate them to Baudot, shove them out by magic to the transmitter, and gather strings of Baudot characters from the receiver through reverse magic, translate them to ASCII, and display them on the screen.

If he was just shoving ASCII out a serial port, it'd be trivial. And, of course, the conversion to and from Baudot is easy, too. It's the "magic" part that I'm unsure of.)

In the meantime, I'm gonna send him a copy of the Baudot character set, in case that does him any good.

AdTHANKSvance for any help.

3265. Re: kamterm tnc software for Kantronics KAM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-24 12:36:03 UTC
From: jim@n5ial.mythical.com
Message-ID: <1994Sep24.123603.32515@n5ial.mythical.com>
Source record: 47357

In article <35s63g$4ae@reznor.larc.nasa.gov> eckman@eos1.larc.nasa.gov (Richard Eckman) writes:

> Quite sometime back I briefly used a shareware software package
>called kamterm which, as the name implies, controlled a Kantronics
>KAM.

Actually, I've regretted that name for a long time.... KAMterm is a host mode terminal program for Kantronics TNCs (any Kantronics TNC that has recent enough firmware to support host mode). I named it KAMterm because when I wrote it, I was writing it (originally) for use with my KAM. :-)

>I recently have been looking for the package on the
>usual anonymous ftp ham radio software sites, but can't
>seem to find it anywhere. An 'archie' search also came
>up with nothing.
> Does anyone know if this software is still available from an
>internet site? Thanks for any information.

KAMterm used to be kept up-to-date on SIMTEL20, but when that went away, KAMterm lost its ftp site. I've got another site in mind, but there are a few things that have to be taken care of before I put it there. Where are dos apps being archived these days?

Of course, it really wouldn't matter much if it were out there---I'm about to release a new version (version 1.30) as soon as it's out of Beta testing, and any release you'd ftp would just be old anyways. Btw, until 1.30 is out, the current version is 1.22.

Feel free to e-mail me for more information. If you do, please send your mail to me as gagme.wwa.com!n5ial!jim instead of jim@n5ial.mythical.com. My primary UUCP feed is in the process of moving from one feed site to another, and it seems that mail to mythical.com sometimes still wants to route via the old path, which I gather he doesn't call very often anymore....

Later,

Many sites carry the special newsgroup named "junk," which is specifically
designed to accept test messages. Nobody reads the junk newsgroup, unless
they are checking to see if their message arrived.

3267. 9600 baud compatible VHF/UHF mobiles?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-24 15:04:35 UTC
From: philkeys@pt.olympus.net
Message-ID: <philkeys-2409940704350001@ptpm009.olympus.net>
Source record: 47358

I haven't started packet yet but I am considering buying a mobile VHF/UHF
dual-band rig and have some questions.

Will most rigs support 9600 baud or only those that are "data ready"?
What features are required for reliable 9600 baud packet (max deviation)?

Do crossband rigs offer any particular utility for packet?

Any experience and /or recommendatiopns of particular rigs is appreciated.

Thanks

From: rapp@lmr.mv.com
Message-ID: <R5F7sc1w165w@lmr.mv.com>
Source record: 47298

Hi folks,

Apparently there are problems with X1JR2 which result in "node busy"
messages and require a reset.

1. Do I understand correctly that there are no further revisions planned?

2. If that is the case, does anyone know if the source code is available
and, if so, where?

3. Is anyone else working on the problem?

Thanks, & 73,

Larry W1HJF

From: n6ng@crl.com
Message-ID: <362an2$ic8@crl7.crl.com>
Source record: 47362

I've ftp'd several versions of Graphic Packet and have yet to find on
with English docs. Is this a trick... I see others talking about it
and it seems to be fairly popular but maybe they all have someone
who reads German (I'm guessing of course, since I don't read German).

Just curious... I haven't been able to make the German version work, mostly
because I don't understand the error messages or the config file...

Just curious... Maybe you get an english version when you register?

Also I would be interested in others opinions of this program...

Thanks...

3274. NOAA Weather Radio-162 MHz band-WRSAME

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-25 00:05:35 UTC
From: evanhill@news.delphi.com
Message-ID: <362esf$3m0@news.delphi.com>
Source record: 47363

Does anyone have any technical information on WRSAME?
(Weather Radio Specified Area Message Encoder)

Would like to know mode of operation, speed, as well as the content
of the message. (coded or plain english).

I have a brochure describing a radio made by Nemar, Inc of Dallas, TX
which describes the features of a weather radio that makes use of
the WRSAME data. The radio is programmed by the user. The user can
program the radio for 31 event/location combinations. The user will then
receive a warning for a specific event or geographic location, instead of
an entire metro area. The brochure does not give any other specifics.

The NWS in Kansas City is currently using WRSAME when issuing watches
and warnings. There are 3 short bursts sent prior to the 1050 Hz tone.
The total time is about 2 seconds for all 3 bursts.

I've talked to a few of the NWS personnel and some amateur radio people,
and have not been able to get this information. Since tests, watches, and
warnings are not issued every day, it's difficult to experiment.

Would like to make use of this feature using my PK-232 if possible.

Well, that may be the case, but either way, you cannot connect a PSK
modem to the KPC 9612.

> : The AEA PK-96, however, does allow you to connect a PSK modem to it,
> : and should be "compatible" with all the pacsats.
>

Yes, the AEA PK-96 can do both 9600 and 1200 bauds.

There is an article in this months (?) QST. I read it in the local
grocery store a couple weeks ago.

For a plain terminal type communications program, try mskermit. It
is public domain (not shareware) and you can find it on the ftp
archive oak.oakland.edu in with path /pub/msdos/kermit/msker313.zip.

3277. Any IP tunneling software ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-25 06:41:13 UTC
From: jf1bff@diptx1.dgw.yz.yamagata-u.ac.jp
Message-ID: <JF1BFF.94Sep25154114@diptx1.dgw.yz.yamagata-u.ac.jp>
Source record: 47374

Hi,

Our club's plannig the gateway that connects
50 km apart amateur radio tcp/ip communities.

2 gateways will be connected through the local
universitys' leased line (TCP/IP spoken there).

Like this:

```
~~ V V ~~~
radio | | radio
TCP/IP | | TCP/IP
GW1 GW2
| |
Ether Ether
| |
+ ====leased line==== +
```

The GW1 is SPARC Classic and GW2 is Sun3/50.

The first plan was simply use the IP forwarding.
But my 'SENPAI ;)' told me better not use that
beause of the licence problem.(Any one could
go out the radio from university if the routing
table changed)

Now we are thinking of use "tunneling" between
the gateways.
So I want to know any free tunneling software
implemented on SPARC&Sun3 is available.

Well, I heard "IP over AX25 over IP" once.
Do you think this works in this case ?

Thanks in advance.

Phil Keys (philkeys@pt.olympus.net) wrote:
: I haven't started packet yet but I am considering buying a mobile VHF/UHF
: dual-band rig and have some questions.

: Will most rigs support 9600 baud or only those that are "data ready"?
: What features are required for reliable 9600 baud packet (max deviation)?

Most mobile rigs work fine when modified for 9600 baud packet. If nobody has a mod for it then you can probably figure it out yourself since most radios are designed virtually the same as the others and use the same IC chips and the 'tap' points for 9600 are almost the same. About the toughest radio I've seem to mod for 9600 is a Kenwood TM-731A dual-and mobile, and mine runs just fine on both VHF and UHF at 9600. A 'data' radio optimized for performance is better though (like a Kantronics D4-10 or TEKK rig), but my TM-731A runs fine at a TXDelay of 8 (80 ms) and receive people fine when they run 4 or 5. If your rig requires a TXDelay of more than about 10 - 15 or so then look into something better. There's no reason for anybody to run TXDelays higher than about 15. If they need higher then there's something wrong, even an HT with a slow squelch will work fine around 15 and under.

: Do crossband rigs offer any particular utility for packet?

Depends how packet is done around your area. If people are spread out all over VHF and UHF, then having a dual-band is nice so you can float around (assuming a not very well connected network). Or you can run dual-receive and single transmit, which I've been running on and off when I test out modems.

Another thing about dual-band radios. Seems that many, if not all, still have both bands receiving even if you turn a subband off. I can turn on UHF and disable VHF entirely, but the VHF receiver will actually still be running and if I have a 9600 modem hooked up it'll still receive packet on it.

3287. TAPR Internet Info

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-26 04:15:51 UTC
From: gjones@tcet.unt.edu
Message-ID: <365htn$4ah@hermes.unt.edu>
Source record: 47370

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server
that TAPR provides allows anyone to request information on TAPR,
products, newsletters, and lots of other files. To find out more about
this service, send an e-mail message to listserv@tapr.org with the
subject line "Request" and the following text in the body of the
message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of
instructions for info, "index -all" retrieves a list of available files
by topic and "taprinfo.txt" retrieves a text file containing information
on TAPR and what TAPR is all about. If you want to retrieve several
text files with one message, use a separate line for each "get filename"
request.

Come join in the fun!

TAPR Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list
of SIG groups, send an e-mail message to listserv@tapr.org with the
subject line "Request" and the following text in the body of the
message:

lists

To request the information on any mail group, send an e-mail message
to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with
the following command:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your
Name should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG

HFSIG SIG on HF Digital Topics
DSP DSP Software Development Forum
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits

---

FTP users

The TAPR Software Library is now available via anonymous FTP. You can access the library by ftp access to 'ftp.hereford.ampr.org' in the directory pub/hamradio/tapr. Login in as 'anonymous', with a password of 'your_account@internet_address'.

Source record: 47371

Perhaps Digicom>64 is the answer to this question. It was written by
Florian DL8MBT and his team who later produced the well-known Baycom system.
They kindly put Digicom>64 in the public domain.

Instead of the AX25 protocol being handled in special hardware and software
in a TNC, the hardware requirement is limited to a simple one-chip modem
plugged into and powered by the C64 or C128 cassette port. This is connected
to the radio by a cable such as those used between a TNC and radio.
Digicom>64 performs the role of TNC and terminal all in one. Version 3.60
which I have been using for a couple of years allows the '64 to be used
as a four port node and if a disk-drive (eg 1541) is available, a personal
BBS. It really is a great program.

I built my modem to a design in 73 magazine and it cost the equivalent of
perhaps 30 US dollars to build. It is only 3"x2" in size and was the first
pcb I'd ever made so it can't have been that difficult.

I am hoping to post Digicom>64 v3.60 and docs to
comp.binaries.cbm in the next couple of weeks. Would any of the ham ftp
administrators like to upload it?

I am only a beginner with Digicom as there are many features I've never used
. Are there any other Digicom users out there on Internet?

Stephen

3292. MFJ and FBB, how????

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-26 16:18:41 UTC
From: briane@goofy.iaccess.za
Message-ID: <366s91$2ok@goofy.iaccess.za>
Source record: 47375
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

I have just ordered n MFJ 1276 TNC from the States. My intention is to run a BBS on VHF, with Pactor forwarding on HF. I will be using the (F6)FBB software to run the BBS (v 5.15).

My question arises from the set-up instructions contained in the FBB manual. It states that "...for TNC-2 or close clones. The EPROM of the type 27256 must be replaced by a special EPROM with the WA8DED host mode software, or by the German TF4, TF8 or TF18" (Pg 37 of manual)

Now the MFJ advert that I saw prior to ordering my 1276, says that the MFJ is a clone of the TNC-2 type, totally compatible with the TAPR system, and is used in the US for digi's and BBS's.

Q1. Do I need to order the special EPROM mentioned, or does the MFJ come standard with the "right stuff".

Q2. What software are the majority of BBS's in the USA running on, here in ZS land, FBB is the favourite. If not FBB in the States, is the favourite available via FTP anonymous site.

Please e-mail to my Reply To, or [:-(] post replies here.

Many thanks for taking the time to read and assist in this matter.

Cheerio,

Well... it was bound to happen... I lost a hard drive through my own stupidity... but that is another story! :)

Of all of the hard disks to loose it had to be my Ham Radio 170 Meg drive! So... those of you that have come to look for my Ham Radio Software for the Mac list... it was trashed... but I resurected an old version... adding to it now... and ti will be out before then end of the month... sorry about that!

Now.... does anyone have the parameters for setting up a Quadralink (non-DMA type) to work with NET/Mac? I lost my autoexec.net and have to rebuild it. I am using a Centris 650 and the card is in the center Nubus slot.... I am running a SLIP link to my PC through the printer-serial port... which I have working... just need to get the Quadralink board online.

Thanks in advance.

3298. BAYCOM and ICOM W2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-26 18:27:38 UTC
From: jcaradim@gr.oracle.COM
Message-ID: <9409261827.AA10625@GRSEQ1.gr.oracle.com>
Source record: 47373

Hello folks,

I am trying to connect a BAYCOM modem to an Icom W2 transceiver, with very diss
apointing results.

Althought, I have repeatedly done a similar connection to an ICOM IC-24, the
W2 seems to be a totally different kind of beast.

If anyone has ever interfaced the W2 to the BAYCOM, I would appreciate, if you
could drop me a posting at the address specified in the signature file. Sorry,
my connection to Internet does not allow me any more, to read the list, so pers
onal answers are in order.

I would very much appreciate any hints you might have.

I'm using a Kantronics KAM (both HF and VHF), with my Mac IIfx or PowerBook 170. I use zTerm part of the time, but have started using the Kantronics HostMaster software. If I get any "spare time", I'll work on my own code some more.

Well, then, I'm right. DOS is 95% poorly implemented.

But seriously, consider the list of similarities and you may raise your estimate. Where did Microsoft get the idea for subdirectories, for device drivers, for command line stdout redirection and pipes, for a PATH environment variable (and for environment variables themselves). The list is pretty long. Many aspects of DOS 2.0 were inspired by unix, pure and simple.

It's just that they didn't want to implement demand paged virtual memory or pre-emptive multitasking.

>There's also a list of what ANY operating system is supposed to do, and
>DOS doesn't manage many of THEM either! This means that DOS is not even
>truly an operating-system - it's more of a "program runner" with a
>little bit of "memory management" thrown in.

I'd call it memory mis-management --- and Windows is sort of a glorified shell.

Hey, don't read me wrong. I can hate DOS with the best of 'em. I just like to point out how similar DOS and Unix are, especially when folks say that they don't like to use Unix. On the systems I administer I have a package of aliases and shell scripts that make the Unix command line work almost exactly like the DOS command line (except, of course, for Ctrl-Alt-Del, which you don't need). Still, many of my users still say they'd rather use DOS because it's more user-friendly. Go figure.

(BTW. Drive letters came from CPM, not Unix. I think FCB's came from CPM too, but I'm not sure. Anybody know? Thank goodness DOS dosen't have PIP. But wouldn't it be great if it had carriage-return initiated multitasking like RSX-11m, another CPM inspired OS.)

I can't speak for the Newton (doesn't have Intel Inside :), but a colleague and I both have sucessfully operated packet from our HP-100 palmtops (with a 9V-powered KPC3 and regular HT). Quite literally, "packet station in a lunch bag."

My particular favorites are sending packet mail from halfway up the ski slope (7500') on Mount Hood (near Portland) and from inside the caldera of Crater Lake (southern Oregon). AT&T says "You will", but hams can say "I already do" (albeit at 1200 baud.... :).

From: elendir@enst.fr
Message-ID: <368pp8$mn0@cismsun.univ-lyon1.fr>
Source record: 47316

Hi !

Well, that's just a weird idea.
I was wondering about the possibility of setting up a 10 GHz/2 Mbauds EME
link between the US and Europe.
That'd be fantastic, wouldn't it ? Each time the moon would be up, we could
transfer enormous amount of data...

Let's assume a 10 W output and a 33 dB dish. Attenuation is something like
280 dB ; so we get -237 dB. We have again the 33 dB gain, so it goes -204 dB
or 446 pV sensitivity.

That's tough, but why not ?

From what I've read about 10GHz EME contacts, libration (sp?) causes the
CW note to spread out considerably in bandwidth. Your method of
modulation would have to account for this effect, which I believe is quite
random.

Hate to tell you, but the *only* mud code you're going to find is for
TCP/IP. Though there is one that works over Appletalk on the Mac, I
guess (hadn't thought about that). You're either going to switch over
to TCP/IP (easy) or totally rewrite the MUD driver (not so easy).

There's nothing weird about that at all. In the early 60's the US military
ran a 4 channel multiplexed RTTY link between Washington and Honolulu via
EME for several years although for a 2 Mbaud data rate I think you'd need
a bit better link margin than you mentioned. I'm surprised that it hasn't
been done already. With the current decline in the solar cycle one system
like this would probably be able to handle 80% or more of the transatlantic
packet traffic.
Any volunteers?

Hello all

I will be in Cincinnati Ohio on the 2nd of October and I will
have my hand held and Baycom. I have an ARRL repeater directory with
packet information, but was wondering if anyone here has any preferences
for best packet frequencies to hang out on while I am there, or any
ideas on frequencies to start out with?
How about any ham fests or flea markets in the area also, that
might be interesting?

Marty kd8bj

3321. BBS Software?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-27 21:28:34 UTC
From: mmunster@qualcomm.com
Message-ID: <mmunster-2709941428340001@mmunster-mac.qualcomm.com>
Source record: 47309

I am interested in a concensis (sp?) of opinion on what is the best Packet BBS software and why. I am interested in two opinions, one from the sysops point of view and one from the users standpoint. Which one handles traffic best? Which is the easiest to take care of? Which one uses the computer more efficiently?

I don't know all of the types out there, but some are W0RLI, F6FBB, MSYS and many more. If you want to respond directly, I will sumarize and repost the results.

Thanks in advance for your input.

3322. [Q]: FBB(5.15)+BPQ(HF&VHF)+modem. Modem does not answer...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-27 21:45:11 UTC
From: "Nick M. Safronov" <NickS@asc.e-burg.su>
Message-ID: <ABrC9YkiF6@asc.e-burg.su>
Source record: 47262

Hello and thanks for reading this posting.

We are having trouble with FBB(5.15) + BPQ(HF&VHF) + modem. Modem does not work properly in answer mode (it does not answer incoming calls) but it works in originated mode. Modem is internal 2400 and works very good with other terminal programs (Telemate 3.10). The computer is IBM PC-AT (10 MHz).

If you can help us, please send an email to me. I'd love to hear from you!

MANY thanks, in advance.

73 de Nick, RZ9CN, member of RZ9CWW radioclub.

Macintosh Amateur Radio Software - Sept. 1994
Version 1.0.8

Sorry I have been so delinquet in getting this list back to the nets... but I have been busy trying to recover from a hard disk crash! Please note that I have changed my e-mail address for BIG files. If you are so inclined to send them... please send them back to the address this post originates from.

Please feel free to distribute this list as widely as possible. Many of you have asked if it is OK to cross-post this list? I don't mind, but I would like to know where it is going. If you think it should be cross-posted to other USENET groups, please let me know so I can try and manage these. We don't want to have any duplication or our welcome will be wore out!

Those of you that can tell me about ANY of these programs compatibility with System 7 would be appreciated! I am going to be adding a System 7 compatability section to EACH description in future releases. If the application is KNOWN to execute properly under System 7, the System 7 anotation will be placed as the last line of the product description. More clarification on levels of System 7 compatibility in the future editions... but this is a start!

Some of the information in this list was gleaned from flyers supplied by the software vendors, or in some cases from reviews in amateur radio publications or the README files included with the archive. Some of the information has not been verified for a long time; please check with the vendors/authors for the latest product specs, pricing, etc.

NEW/CHANGES: I am continuing to add more version numbers so that our users will know if they have the most current release. Thanks to those that have already sent them in... I'll accept all corrections! I just saw on the net two other lists that I'll try and compare with this list very quickly and see if there are holes!

A new release of both NET/Mac and IM/Mac are now available.

The Mac version of Automatic Position Reporting System (APRS) is is NOW available at ucsd.edu. It really looks great... thanks Mark and Keith Sproul!

Check at the bottom of this list for more information on ftp'able sites carrying Amateur Radio software. The ARRL ListServer is also carrying the latest version of this list... in case you loose this one!

*** Collections ***
<MacNet v5.31>
Join MacNet and get included in the latest version of "Macnet Roster", a HyperCard 2.x stack that now has > 400 members and is the proverbial "Who's Who" of hams using Macs. You'll find "Macnet Roster" a great tool for finding out who, what and how other hams are using their Macs with their ham stations. It even includes this file!
Send $30.00($40.00 DX) check or money order to: WD1V, John Seney, 144 Pepperidge Drive Manchester, NH 03103 USA.
All disks shipped First Class Mail PPd. Get the COMPLETE Macnet Software Collection ppd. on 10 disks!
Based on your interests, you'll also receive public domain shareware received by our members.
System 7

<Project Mac>
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection. Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, One Glen Ave., Wolcott, CT 06716-1442. Stan can be reached at horzepa@gdc.com
NOTE: Stan has indicated much of this software is "old" and may not work on some newer Macs. Also he notes that most of his collection is available in the MacNet collection above. He will send anyone what he has if you send him the disks and SAS mailer.

<Amateur Radio Software for Macintosh>
<Amateur Radio #1>
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs. Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

*** Test preparation ***
<Ham Test Stacks>
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests. The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions effective 7/1/93), General v2.4, Advanced v2.4, Extra v2.4.
Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com
NOTE: Diana no longer is supporting this software, she no longer has a Macintosh computer. Diana, thanks for your wonderful contribution to the Amateur Radio community for these stacks!
System 7 savvy with HyperCard 2.1

<MacHam>
Test generators and study aids for the Technician, General, Advanced, and Extra class written elements. Includes the complete question pool for each

license. Hypercard based.
Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.
System 7 with HyperCard 2.1

*** Morse code practice ***
<N6MZV Morse Trainer>
Lets you practice any combination of letters, numbers, and/or punctuation characters. Can send user-created text files.
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio).
Shareware.

<Morse Code Tutor v1.6> - used to be called Morse Tutor
Sends random groups of letters, numbers, and/or punctuation characters. Available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Or send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB, 726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

<MorseMania V1.0>
Designed for those already familiar with Morse code who want to improve their speed. Allows code practice at various speeds and audio pitches. Can generate random sequences or play the contents of user-created text files. Freeware. Available via anonymous FTP from simoon.stanford.edu (/pub). Contact Edward Plumer, KM6IQ, for more information; Internet: plumer@simoon.stanford.edu.

<MacMorse>
Randomly sends chosen characters. Lets you create your own practice files. David A. Kall, 700 Marine Parkway #314, New Port Richey, FL 34652.

<MacMorse v1.3>
MacMorse is designed to help you learn Morse code and improve your receiving speed. It has several ways that it can send letters and punctuation. Shareware. Doug Havenhill, Dynamics and Control, 7143 West Sunnyside Drive, Peoria, AZ 85345.

<MacSamuel>
Sends random words, random character groups, and user-created text files. Can also create simulated QSOs with randomly generated text and callsigns. Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

<Zihua Morse>
Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads the characters out loud for an accuracy check. Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

<Sparks-II v2.0.5>
More Code training program. Available for anonymous ftp at rahul.net /pub/davidj/radio

<Morse Master v1.0>
The newest of the morse code training programs. MM calculates the real speed as follows: Real speed = Number of Words/end time - start time. And the lengh of word is generating randomly, so if you set even 5WPM, sometimes another value will appear. However you should believe the slidebutton's value. If you repeat many times, the average speed should be 5WPM (if not... anyway, believe the slidebutton's value). Archive is available mac.archive.umich.edu, path: mac/util/organization/morsemaster1.0.sit.hqx The author can be reached thru the following e-mail addresses: h79261a@kyu-cc.cc.kyushu-u.ac.jp. (Eiji AOL account is no longer valid - moved back to Japan after his studies.)

<Morse Trainer-US v1.1.1>
MorseTrainer is a powerful tool for learning and training Morse code. Features: Three different training modes: user text, random text, library text; Arbitrary signal pitch and timbre; Arbitrary speed and tempo; Multi-alphabet support; Random text generator; Text library editor; On-line alphabet; On-line manual; Help Balloons; And a lot more. New features in 1.1: Enhanced sound generator, volume control and risetime control. The pitch is set in steps of 10Hz instead of using MIDI frequencies; Speed and tempo limits increased to 80 words/minute as a result of the enhanced sound generator; User-selectable font in the Misc settings dialog. FREEWARE!
This version uses TrueType fonts instead on bitmaps fonts so that the user can distinguish 0(zero) from O(character). Furthermore speed and tempo can be given in either characters/minute or words/minute. Archive is available mac.archive.umich.edu, path: mac/util/organization/ Author is available via internet: sund@tde.lth.se
System 7 savvy

<CW Speed Builder v3.0>
This program is for improving Morse Code (CW) reception skill. The major difference between this and other Morse Code training programs is that this one will not continue sending until you provide the correct answer. Major changes which have been suggested and implemented since last version include: after three incorrect responses the program shows the correct character; the list of characters at the end which will show those you know and those you need more practice on; the frequency of the tone has been changed; volume of the tone has been reduced; the character " - " has been added (dah dit dit dit dah) Comments can be sent as follows: America Online:K7UPJ, Internet:k7upj@aol.com, Packet radio:K7UPJ@KA3T, Compu$erv:70521,2356, Mail:Box 84, Cascade, MD 21719

*** Packet and other digital modes ***
<NET/Mac 2.3.44>
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC with KISS mode. Copyright, but free for noncommercial use. The latest releases have added support of multi-port serial boards like AE's QuadraLink. It is now possible to have up to 16 TNCs connected up to a Nubus Mac!
Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the

modifications to NET/Mac. This version (and others) is available via
anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming),
mac.archive.umich.edu and oak.oakland.edu (/pub/hamradio/mac/digital/)
System 7

<Domain-to-Hosts Converter 1.0r3>
This application will create a hosts.net file from the domain.txt file
that PC owners use with NOS. Created by Ken-NS1C is available on many
TCP/IP packet switches in New England.program.
System 7

<IM/Mac 1.0b28c>
Mailer program for use with the SMTP protocol. Alternative to the BM
program that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is
continuosly updating his mailer program. His newest release supports
StuffIt Expander 3.5.1,built-in BinHex support, selectable sound chimes
for incoming mail, "quoting" of forwarded messages and lots more. If you
are not using this program... why not? Check for the latest release in the
directory before "blind" ftp'ing. This software supports System 7's
Ballon Help and is System 7 savvy! Available via anonymous FTP from
ucsd.edu (/hamradio/packet/tcpip/incoming).
Author is available via internet: on1xk@igg.tno.nl <<-- new address for Ivo!!!
System 7 savvy

<SoftKiss 1.8>
Control panel device that emulates a TNC running in KISS mode. For use
with packet-radio modems such as the Baycom kit and PacketMac Modem.
Version 1.8 July 9 1993 update since 1.6. KD6PAG found a bug in quoting
recieved escape and end characters is sofktiss 1.6. The bug and the fix
and patch are all correct, thanks for some great detective work. Lots of
doc files and drawings included in this archive! Requires the Serial Tool
from Apple's Communications Toolbox! Available on the HAMNET forum of
Compuserve, America Online and via anonymous FTP from
akutaktak.andrew.cmu.edu (/aw0g).
System 7

<PacketMac Modem>
PacketMac Modem kits can be obtained from: Sigma Design Associates, P.O.
Box 49085, Colorado Springs, CO 80919, (719) 260-5513 (after 1/94). Dexter
Francis can be reached at FRANCIS4@AppleLink.Apple.COM

<Savant 1.0.2>
A new packet terminal front-end by the author of Virtuoso. Savant has a
split window interface, but it's also a multi-window, multi-connection
interface and will work with almost any TNC, unlike MacRatt or HostMaster.
A demo version of the product is available at cpre1.ee.iastate.edu
(pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to CM
Technologies, Inc., RR#1, Box 83A, Kelley, IA 50134 (515) 597-2051.
System 7, 32-bit, '040 cache clean and it supports the required
AppleEvents.

<MacRatt with FAX>
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable. Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA 98036.

<Host Master 1.2>
The Kantronics Host Master software provides an easy to use, multifunctional terminal program for the TNC. Host Master Mac is a simultaneous multi-mode terminal program for the Mac written by Kevin Krueger, N0IOS and marketed by Kantronics. It is a commercial product available from most of the ham radio stores and supports single and multiple packet connects, packet monitoring, and HF operation (with KAM) each on a separate window, all at the same time. This package retails for $69.95 in the US and is intuitive, friendly, and well supported by Kantronics. Current version as of 10/20/93 is 1.2. It is hoped that a future version will support FAX but currently Hostmaster supports PACKET, AMTOR, RTTY, PACTOR (KAM ver. 6.0), CW, and NAVTEX. Features: text and binary file transfer; packet conferencing; color or B&W windows; cut, copy, paste between windows; call exchange and data/time stamp; auto startup/shutdown commands; transmit buffers for each mode; simultaneous dual port, multiple connects; supports KPC-2, KPC-2400, KPC-4, KAM and Data Engine. Requires: Macintosh Plus w/ System 6.05 or better. Current Kantronics firmware.
System 7 compatible, with baloon help

<PacketTracker 1.07>
PacketTracker ver 1.07 is a SHAREWARE program that monitors packet activity and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. PacketTracker was written for both the casual packet user and the network manager or BBS operator. The casual packet user will be able to learn a great deal about what is happening in packet around him; which stations are generating the most data and what some of them are. he will be able to see graphically what stations he can hitdirectly and which ones he cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox which is NOW included in the archive.
System 7

<MacAPRS>
There will soon be a Mac version of the APRS (Automatic Position Reporting System) software. Folks use this to collect packet beacons, plot channel activity, track chase vehicles for marathons, etc. When it's out, I'll let you know.

<DSK_Loader 1.0>
DSK_Loader is the Macintosh equivalent of the DOS program DSKL. With this program you can communicate with the DSK (DSP Starter Kit) from Texas

Instruments. This program bootloads a simple communications kernel and then loads other software using this kernel. Other options are: Fill DSK memory with a certain value; Dump DSK memory into a textwindow, for further processing; Execute programs on the DSK; Graph output from the DSK; Act as a dumb terminal to the DSK.
The DSK and thus DSK_Loader is most interesting for people who want to experiment with Digital Signal Processing at low costs. For HAM-Radio operators it is a very interesting piece of equipment, Some applications, like the KC7WW port of the W9GR filters are included.
This program is public domain so you can distribute it to others, put it on BBS's, FTP sides, etc. If you encounter some problem s, bugs, find language mistakes in the help-information (english is not my native tongue), or just want to know me that you use this program, feel free to write to the address below, by email, or just postal mail. Please add information about the system you use, and the application you use the DSK for. I also like to hear your wishes for future versions.
Author is available on the internet: G.Polder@CPRO.AGRO.NL. Gerrit Polder-PA3BYA, Prunus 8, 3904 LV Veenendaal, The Netherlands

*** RTTY ***
<MacTTY>
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages. Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

<WeFaxWorks>
Weather facsimile terminal program for use with Kantronics TNCs. Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

<MacMultiCom 1.0>
MFJ sells MacMultiCom 1.0 for their 1278 multimode controller. MacMultiCom supports all of the modes of the 1278: packet, rtty, ascii, pactor, amtor, gray scale faxes, and many different formats of color sstv. The program requires a minimum of a MacPlus and a hard disk. Requires a color Macintosh and System 7 for best results.
System 7

*** Logging ***
<Ham Radio Station Logbook>
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

<FDLog!>
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

<MacContest 3.5>
Allows real-time or post-contest logging of a wide variety of contests. Checks for dupes, figures scores instantly, and offers various printouts. Interfaces to TNCs for CW and RTTY contests, to DX packet clusters, to Kenwood transceivers, and to MacinTalk for easy post-contest entry. Gerald Eberle, HB9CEY, P.O. Box 13, CH-4417 Ziefen, Switzerland.

<LOGic>
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

<HF Logger 1.2>
A real fine HyperCard logging program! (hey... thats all I got!) N0QGQ

<Simple Log .2b>
This little utility is a handy way to create a logging file that you can later import into any data base for analysis, etc. It also shows you that just about anyone can use Think C and create something on the Mac! Let me know if you'd like the source code. WD1V @ WA1WOK.NH.USA.NA Author is John Seney - WD1V, e-mail address is jseney@aol.com. For a copy of this program, mail a SASE disk mailer and 800K disk to: John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103
System 7

<Marathon>
Contesting/logging- Have seen references to (March 92 CQ magazine) and heard good things about MARATHON by N 0 IOS. I believe a demo was available for $8. Last address known is: Kevin Krueger, N0IOS, 1780 Ruth St., St.Paul, MN 551O9

*** Callbook data tool ***
<Hamcall 2.0>
This is the application that is used to support Buckmaster's Hamcall CD-ROM. This application provides much more data than previous versions including lat and long coordinates. Allows search by callsign as well as Zip Code sorts.
More information at info@buck.com
System 7

<SAM>
Amateur Radio Callsign Database now supports Mac interface. No additional information at this time.

*** Propagation, gray line, DX headings *** <DX Map v1.1>
Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware. Requires HyperCard 2.0. Available via anonymous FTP from

joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

<SatTrak>
Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<Sun Clock>
Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location. MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

<DX Window>
Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.1>
Enter solar flux and get propagation predictions to desired areas of the world. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.5>
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<DX Helper v1.57B>
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

<Mac MiniMUF v5.1>
A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer). His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

<Mac ShortWave v1.2>
A program called Mac Shortwave that figures MUF and LUF. BXA Research in Plano, Texas

*** Satellite tracking ***
<SatTrack v1.02>
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also

calculates beam headings, Maidenhead grid locations, and MUFs. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306. System 7 compatible.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.
System 7

<OrbiTrack>
<OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). Please note that one version requires an FPU to operate! BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)
System 7 compatible

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<MacSPOC>
Author is on AOL and can be reached as adamod@aol.com via the internet. The "demo" versions can be found at ucsd.edu.

*** Antenna design ***
<MacMiniNEC>
Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

*** Radio control ***
<ICOM Radio Control>
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

<FreqValet>
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087. Telephone (817) 441-9188 or (817) 441-5555 (fax). Author is available via internet: dxcomp@aol.com System 7 with HyperCard 2.1

*** Ham radio BBSs ***
<Digikron Systems BBS>
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

<N8EMR BBS>
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

<WB3FFV BBS>
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

<ChowdaNet BBS>
(more info at a later date)

<Gallery's BBS>
Gallery's BBS is now available to the general public.Specializing in Amateur Radio shareware for the Macintosh computer.The board is open 24hours a day,7 days a week at 202-298-6009.Supports up to 9600 bd connections.Give it a call today! e-mail queries to:paulot@cais.com or N3MGA@WA3TAI.MD.NOAM

*** Online Services carrying Ham Radio software ***
<America Online>
Supports Macintosh, PC's DOS & Windows versions, PS/1, Apple //s, Casio

Heck, _DOS_ came from CP/M. The guy who wrote it wanted a quick O/S
and basically wrote a sort of a version of CP/M for 8086.

>AdTHANKSvance for any help.

No problem. You're going to run into a little problem: the Mod 4 is a
Z80 CP/M machine. I doesn't grok MS-DOS. It groks TRS-DOS, or with a
hardware mod it can grok Montezuma Micro's CP/M port. There was a
comment thread in comp.os.cp/m about MM-CP/M for a Mod 4 just a few days
ago. Look there before it expires from your site. I believe there is a
hardware newsgroup something like comp.sys.tandy? or comp.sys.radio_shack?
They might have a pointer on the hardware mod or the MM-CP/m or other
useful info on that little orphan. They are nice machines - I had one
for a few months.
The serial port hardware can be easily programmed for 5-bit I/O, and
RTTY is inherently simplex - I talk a while, you "print". You talk a
while, I "print". The better software, however generally runs split-screen,
allowing me to "print" you on the top half of the screen while I
compose the reply to you at the same time. This means the software is
constantly bouncing back between sampling the keyboard and the incoming
serial port, and never taking longer to do anything (even scroll the

screen) than one character time (which at 100wpm 5-level) is a little
faster than you think).

When the other side is done printing, a hit on a function key begins
sending from the top of the send buffer at full speed, while any
keyboard entries are added to the end. When the buffer is exhausted, the
user can type at keyboard speed (i.e. the buffer empties as fast as it
fills) or drop carrier. At the same time the program has to watch the
receive side of the serial port - the user could be on a full duplex
link... Yes - I used a RTTY - 5-level on-the-air BBS ... that concept
isn't totally new to packet...
Some of the more sophisticated programs allowed the user to store
canned strings prepared with the program or with an external text editor
as files and paste them into the send buffer, and to capture stuff
from the receive buffer and save them as files... Likewise a function
key would turn off and on an external printer.

There is a certain amount of available CP/M software out there.
I'd first dial up WB6NGC's BBS at 818-799-1632. He run an almost 100%
CP/M BBS (he tolerates ham-oriented MS-DOS stuff) and is bound to have a
CP/M RTTY package. Maybe it will even have source code... Also WB6YMH has a packet BBS here
in Southern CA., and
Skip started the BBS on a S-100 CP/M system. A year ago he had a CP/M
area on the current BBS, if he still does that would be a place to look.
After the Z80 hardware earned a well-deserved rest I know that for a
long time he ran the BBS on a 8086 based multi-user machine running
Concurrent CP/M 86. The last phone number I had for the BBS (and
I can't verify it while I'm logged on here) is 310-541-2503. If it
doesn't work let me know and I'll do some digging.

Second, see the last half of my response here - it's a copy of my reply
to a UK SWL that was looking for the same thing. I'm pretty sure that
at least one of the programs are CP/M.

I finally dug up the name of the 73 magazine columnist and emailed him for
the list. His message is appended.

>I'm just a SWL at the moment. I passed the writen exam eight years ago but
>just never got around to learning the morse for the full Class A ticket!

>Maybe I'll get lucky and hear you on the ether!
Unlikely. I'm not sure what the licensing structure is in GB/UK, but my
license is the "Technician" class - I'm limited to 50mhz and up, and 50%
of my operating is on the daily drive to work and back...

>Regards - Jason

The message from Dr. Marc Levy follows... The "RTTY Loop" referenced is
the name of his column. No, I don't have any more info about the
individual programs - but you could drop mail to MarcWA3AJR@aol.com and
ask. He does his column on a computer, and a while back he had a brief
description of some of the programs - perhaps he could grab that chunk
of text and include it in a response to you?

Mike

Return-Path: <pelican!aol.com!MarcWA3AJR>

Here is the file listing...

The following software collections are available to the readers of "RTTY
Loop." These programs are provided to the readers of the column as a
service. All I ask are three things:

(1) A disk, either 5.25" or 3.5", formatted or not
(2) A stamped, self-addressed disk mailer
(3) Two dollars in U.S. funds for each disk filled

Be advised that at least one of the collections is over the 1.2 Mb
capacity of a 5" high capacity disk. Therefore, please send appropriate
media, and funds, to cover what you want. Also, if you are sending a
foreign money order, please understand that, for example, a money order
from Canada or overseas COSTS about $3 to $5 to cash, thus making a $2
foreign money order worthless.

Here are directories of each of the collections:

3328. TNC (KPC-3 versus MFJ-1274C)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-28 08:29:04 UTC
From: frode@dxcern.cern.ch
Message-ID: <1994Sep28.082904.2026@dxcern.cern.ch>
Source record: 47318

I am considering buying a TNC and would very much like
your opinions, experiences, etc.

I have read the QST review of differnet TNCs in Dec. 1993
and I have narrowed my choice down to the KPC-3 or
the MFJ-1274C. The MFJ-1274C was not reviewed in Dec. 93,
but rather the MFJ-1274B, the earlier model.

I am quite attracted to the MFJ-1274C because it is a true
TNC-2 and it has the possibility to upgrad the Mail Box RAM
to 512K. It also appears to allow for automatic mail
download from your PBBS without any intervention from the
PBBS sysop.

But some of my friemds claim that MFJ is no good, never works,
never works for long, etc. etc. Is this true or is it rather
a bad case of MFJ bashing?

Sorry, there is a major error in your link budget calculation.
about 40 W and 3m dishes are neccesary to get even CW through, normally.

The pin-outs are on the schematic that comes with the radio. If you are missing yours, here is the pin-out. This does not assume any particular interface to packet, someone else may post the actual packet wiring.

1 - Dn Button (Ground to activate Dn)
2 - NC
3 - Mic Audio Hot
4 - Mic Audio Gnd
5 - PTT (Ground to Key Radio)
6 - Ground
7 - 8 VDC from radio to mic
8 - Up Button (Ground to activate Up)

In my experience it's just MFJ bashing. I've had several MFJ 1270, 1270B, and 1274 TNCs, and installed and maintained a bunch more as mountaintop digis. They're very reliable with a couple of minor fixes. I don't have a 1274C so I don't know if one of those fixes applies, but if it truly is still TNC2 hardware then you need to change the LM724 to a TL084 in the RS-232 driver if you want to run 9600 baud or better between the TNC and the radio. The other thing you want to do is pull the MF10 filter and put a jumper in its place. These things should be done to *any* TNC2. You should also sand the paint off the joining halves of the case to make it RF tight. Do those things, and it'll work great and last a long time.

On the other hand, Kantronics finally seems to have gotten it's act together, and the little KPC-3 is a nice *tiny* little box with low power consumption. I still prefer the MFJ due to its TAPR modem disconnect, and the availability of dedicated KISS and TheNet ROM firmware. You can't use external modems or third party firmware with the Kantronics box.

I can't generalize, but I've been running MFJ 1270 and 1274 series for years with no problems. In fact, I've had a 1270 sitting completely unattended for several years acting as a digipeater (until I recently converted it to a node) with no failures whatever.

I think I posted this earlier, but haven't had any responses, so....

There appears to be a bug in the X1J revision 2 software which eats up
memory and results in "node busy" messages. It takes a soft reset to fix it.
I also understand that r2 is to be the last revision.

Has anybody found a fix for this?

Does anybody know how to get ahold of the source code?

Is there any other node software which is compatible with TheNet and IP?

Thanks & 73,

Larry W1HJF - W1HJF @ K1UAQ.NH or here.

: 1. Do I understand correctly that there are no further revisions planned?
I have heard not any indications that no additional revisions are planned. The
X1JR2 documentation states that the next release will be a join effort by
G8KBB and NJ7P. Check the first paragraph of the intro.txt file.

: 2. If that is the case, does anyone know if the source code is available
: and, if so, where?

: 3. Is anyone else working on the problem?
I had NODE BUSY problems. Once I installed a TAPR DCD mod in the TNC the
problems were cured. I have heard that running the node with open squelch
has also been linked to high CRC ERRORS (in the stats display) which
will lead to the same problem. Is there a coorelation between high CRC
errors and when your node bogs down? What is the clock rate of the TNC?
Hope it's not less than 4.8MHz. If it is upgrade that first.
(I've also converted to mostly 10MHz clocks.)

I can't speak for the MFH-12745C, but I have been using an MFJ-1278-T (multi-mode TNC)for about 2 years, and it's worked flawlessly.

It came with a terrific 1.5" thick instruction manual detailing every aspect of operation, including installation instructions for several popular radios, as well as a complete guide to user alignment of the filters and modem.

I've dragged my MFJ TNC into the woods camping dozens of times now, operating it and my VHF rig on batteries without a single failure or complaint. I love it.

Well, I can tell you one thing; RSX-11M and D were around long before CPM was even thought of. I was doing MACRO-11 development on RSX back around 1975. RSX was also the inspiration for a good bit of VAX/VMS as well. There were FCB's in RSX. I think the file naming convention of <device>:<filnam>.<typ> is from RSX, and Files-11. So I think the drive-letter bit was from RSX too. Files-11 ODS level 1 later grew into ODS-2, around 1978. It supported heirarchical directory structures and later 40 char filenames and 40 character file types.

And PIP was cool! Wow, to think we used to have multiuser development systems running on 16bit machines with 248KB of main memory!

We got this Columbia(?) Z80 CP/M desktop system in to evaluate for some product. Engineers were developing code on the PDP-11/34 and moving it using 8 inch floppies to the CP/M system.

I was developing firmware to make single board PDP-11 control a Bridgeport CNC vertical mill.

Meanwhile, while I'm trying to get my boss to let me have that old, unused MicroVAX 2000 for a packet switch...

I feel much better now. Back to my VAXcluster and VMS.

You didn't say what kind of system you want to run a MUD on. If it's a Unix box then it shouldn't be hard. If running Linux then you can put the AX.25 code in the kernel and modify the axl (ax25 listerner) program to connect to the mud server or run a script that does that. Then anyone using just AX.25 can connect to it. Or get something like Phils base code for NOS and put in the connection redirector code so that incoming ax.25 connects to a callsign will actually do a telnet (this will be TCP/IP though) to a MUD server.

Just stick with Unix for the MUD servers and go to TCP/IP. Regardless of how you implement a MUD server over packet (lots of ways and they are usually all pretty easy), you will be running TCP/IP to the actual server, but the end user of the game isn't required to run TCP/IP unless you restrict the end user to running it.

Also don't just set up a NOS system and have users connect to the mailbox and do a telnet into the game or use the JNOS mbox alias command and set up an alias to do that, goofy things happen all the time with carriage returns and linefeeds and terminal emulations. Plus telnets from inside a NOS mailbox are very very slow in repsonse.

I don't recall RSX being particularly derived or inspired from CPM...and i recall there was some way to handle directories and such on RSTS/E (around 1975 or so...it's been a while...).

the whole computing world didn't start with unix or CP/M.

and heck, PIP a problem, nayhh. in a way it was pretty neat...

It's even tougher than that. The moon is an extended reflector and
therefore creates considerable dispersion in the echoed signal requiring
a rather fancy adaptive equalizer on on the order of 10 milliseconds long
with enough taps to accommodate the channel signalling rate. 10 Mbps
is probably rather aggressive.

I have wondered this myself, albeit with my DECmate II, which has the Z80
card. I know that, of all the terminal programs I've seen in the CP/M
environment, Kermit-80 was the only one with a specific overlay for
my machine, oddly enough.

I have been tracking down leads for a CP/M-based KA9Q but have come up
empty. I've even thought of taking Phil Karn's source and running it
through HiTech C (which I've not downloaded yet) to get a working (NOT!)
copy there.

I don't think you need a PhD to do this. I was planning on doing a SLIP
for my HP48 just from reading Douglas Comer's books and Phil's code,
though admittedly I've a CS degree. :)

You'd probably have to accept a more limited feature set than you'd get
on a Linux or even PC box, but for my purposes, that's fine. The DECmate
will be connected to a TNC (radio modem) and the ham radio TCP/IP network
(ampr) and thence by SLIP to my PC. I'd like to explore the HP for
portable applications.

I've crossposted this to comp.os.cpm, alt.sys.pdp8, and rec.radio.amateur.
digital.misc, since the folks there might have more ideas for us.

There is someone here in the UK developing a totally home-brewed MUD for packet. I have forgotten his name and mailbox :-(but try a packet bull to MUD@GBR or something similar.

If that fails, your best bet is to install Linux Unix and run a TCPIP/AX driver with a conventional MUD. I was in the middle of doing this when my hard disk packed up on me (no fault of the software).

Mike.

> That's tough, but why not ?

Tougher than you think. -204dB is for a 1Hz bit rate. 2Mb would be -63dB
below that. -267dB Hmm. Now, tell me about thermal noise.....

Donate the money you save to the Phase 3D satellite budget instead.

Mike.

I have had two digi's running X1JR2 for two months now without any problems.
Both TNC's do have open squelch adapters installed, though, if that makes
a difference.

Just thought I would throw my two cents worth your way I owned a MFJ-1270B which is the same as the 1274 without the tuning LED I switched to the KPC for taking on the road for size and pwr reasons . I would say that they are both excellent machines I had my MFJ for 4 yrs and it is now digipeating on a Hill in PEI. Now the choice should be made based on what you plan on doing with the tnc if you are only going to do VHF work with it then then the KPC-3 is the way to go . If you plan on dabbling in HF packet ax.25 protocol then get the MFJ . For the same price you get one mode on HF . Hope this muddies the waters a little :-)

I've got a MFJ 1274, and I'm very happy with it !

It does everything I want (and more), but I have to say that the documentation could be better. There are one or two errors and ommissions.

My MFJ works - all of the time :-)

Happy packeting !

3360. Help: K9NG Pinouts Needed?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-09-29 13:09:50 UTC
From: broderic@codger.physics.duq.edu
Message-ID: <36eeau$i0q@godot.cc.duq.edu>
Source record: 47258

I have lost my data sheet on the k9ng.

Does anyone know the pinouts from the modem to the radio?

I have deduced (I think...):

pin 2 +
pin 3 TXData
pin 4 Ground

(could also be 4-3-2)

Thanks in advance...
Don Broderick, n3guz

: It's even tougher than that. The moon is an extended reflector and
: therefore creates considerable dispersion in the echoed signal requiring
: a rather fancy adaptive equalizer on on the order of 10 milliseconds long
: with enough taps to accommodate the channel signalling rate. 10 Mbps
: is probably rather aggressive.

I'd say "rather aggressive" is mild (:>). Not only is there bad
spreading but (assuming your attenuation numbers are correct) your
receiver gets to see +40+33-280+33=-174 dBm. Since the moon itself is
about 200 Kelvin at 10 GHz (though with only a 33 dB gain antenna it
will not fill your aperture) and if the receiver has a 1 dB NF you get
about 0 dB C/N in 1 Hz of bandwidth. Shannon has to be reckoned with
and I'm afraid you are now about 7 orders of magnitude away from a goal
of 10 Mbps.

I think you'd stand a better chance with a series of troposcatter links
across the path.

>
> --
John..

It is like the KPC-4 only built in a slightly larger case than the KPC-3.
It has two modems 1200 baud and 9600 baud. You can operate both at the
same time and it does have the ability to operate as a KANODE with
cross-banding. I have had mine for about a month operating 1200 baud on
two meters and 9600 baud on 440. I am using it with KAGOLD software.
I am very happy with the performance. I would recommend considering
the 128K memory (approx $25 US) option if you need a large mailbox or
several NUMNODES.

Greetings,

Would some kind soul please tell me how to get a copy of XPCOM?

My understanding is that this is a RTTY (possibly other modes) terminal
program that is highly regarded by some. I beleive it was written
by KF7XP.

If someone is aware of an FTP site where it can be found please let me know.
Otherwise, I'll try mailing a note to the callbook address for KF7XP.

Thanks in advance.

From: nickb@netcom.com
Message-ID: <nickbCwwH47.EM4@netcom.com>
Source record: 47268

Being a CS and not an EE, can someone please educate me on how I can calculate the bandwidth of a data signal? I'm talking FSK, about 56KB. Is there a general equation for bandwidth? I'm familiar with Fourier Series and Laplace transforms, so if there are any mathemeticians with some patience out there, please explain the theory behind it.

What is this leading to? Well, I understand the main limiting factor for using voice radios for high-speed data is the IF frequency bandwidth. Okay, so I want to investigate redesigning an IF strip to widen the bandwidth. What are the standard parameters?

Thanks for any info. If there is a good introduction somewhere on the net, please point it out.

RSX was *not* a CP/M inspired system, it was the other way around!

There were ex-DEC people at Digital Research, and CP/M was "inspired" by the
DEC systems... TECO and friends gave us CP/M editor commands like:

b#msoldstring^Znewstring^Z0ttl

.. to change every occurrence of "oldstring" to "newstring" and print the
changed lines. Intuitive, eh?

Frode,
If you can afford the extra money, I'd get the KPC-9612. It is a KPC3
with a 9600 baud port too! Otherwise I'd get the KPC-3. I have one
(I got mine about 6 months ago - before the 9612 was announced :-( )
and wouldn't trade it for anything (except the KPC-9612, but I don't
have a radio that can do 9600 yet). I have no personal experience with
MFJ TNCs, nut I did buy one of their mini speaker mikes and had to send
it back for a replacement (the dealer took care of replacement) and the
replacement now (6 months later) needs the cord replaced. I guess my point
on the MFJ stuff is - be extra careful, some of it is good, some bad.

>73 de KD3BJ (Chris Nadovich, chris@kd3bj.ampr.org)

Bill (WB9IVR) is right about CPM vs RSX 11. Actually, as I remember it CPM has its roots in RT-11, RSTS/E, and RSX-11 not the other way as Chris suggested.

What was even neater than PIP, though, was TECO. I never was able to understand how to use it, but I saw some pretty awesome scripts written for it. (TECO was a PDP-11 based text editor sort of like ed, edlin, etc but incredibly more powerful).

Maybe I'm missing something obvious, but why not just kermit into
a unix host and use the DEC box as a dumb term? For SLIP to be useful,
you would really want a multitasking OS, wouldn't you? Unless you
made a SLIP TSR thing just to run a telnet or ftp daemon (although you'd
still need a multitasking OS if more than one person wanted to log in)...
sounds like an interesting hack though, if just for the sake of a hack,
but I thought hacks were supposed to be insant *looking* solutions to *real*
problems...

I have a few questions for the technical people out there. I am
thinking about designing a packet modem that will give transfer rates
around 56k!
First of all, most of the packet modems aout there do FSK at 1200bps.
What really makes me sick is that for 9600bps, people are still doing FSK
and modifying the radio's to get a bigger bandwidth. (I believe this is the
case) Because FSK only uses two levels of representation, why can't we use
some other type of system that will give us multiple levels of encoding.
So with the same bandwidth, we could get "more" information.

To calculate some of this, I need to know the typical ballpark
Signal to Noise (S/N) ratio for a two meter FM with full quieting audio
signal. I also need to know the bandwidth, however, I probably can assume that
it is at least 12khz. Even without knowing these numbers, I am fairly
confident that it is better than the 4khz of a phone line (The phone co
guarantees 30db s/n) The other problem that we might have is syncronization
of the signal. Since we are dealing with a half duplex channel, this could be
a serious problem, however there are ways to get around this. Even if you
couldn't get around the sync problem, the modem would still work well for
Full duplex channels. This would be great for the backbone network at least.

I would implement most of the signal processing in a TI dsp chip. This
would make the modems kind of expensive, But definately worth it! However the
chip count would be low. AND (a BIG and) you could change the software
and speed the modem up without buying a NEW modem. We could also be
backward compatable with the 1200bps modems now.

Other than the problems of S/N ratio, and the receiver syncing on
the transmitter EVERY time you want to transmit data, and the writing of the
software, which I can take care of (hopefully). Can anyone think of
another problem that would sink this idea?

Neither did Unix until just recently. And with respect to pre-emptive
multitasking, it barely does that. Go back and check out the implementations
of System 7 and earlier versions that ran on the PDP-11's back around
1975 or so.

Comparing them is like comparing apples and oranges. At some level of abstraction all monitors or operating systems share some things and differ in others. Neither Unix or DOS has a lock on many if any OS concepts. In particular, much (most) of Unix came from Multics and other 1960's operating systems.

|>(BTW. Drive letters came from CPM, not Unix. I think FCB's came from CPM
|>too, but I'm not sure. Anybody know? Thank goodness DOS dosen't have

|>multitasking like RSX-11m, another CPM inspired OS.)

That's pretty funny. RSX-11M was *hardly* inspired by CPM given that it predates it. RSX-11M development was lead by Dave Cutler (you know, the same person that lead the VMS and NT development teams) and was supposed to be a simplification of the RSX-11D operating system for smaller PDP-11's. RSX-11D was developed from RSX-11A which dates back to around 1971.

Please be advised for any of these schemes that the Z80 is a captive
processor on the DECmate. It does zilch I/O. The 6120 is in charge of
all I/O, and port I/O is subject to the overhead of CP memory. Note that
the hardware limit of 19200 is *NOT* supported under CP/M (9600 baud max).

One of the major changes I need to make to improve Kermit-12 is to
rewrite the slushware to provide CP hooks for polling the port during
too-long CP sequences with -8 interrupts turned off in the terminal
emulator, etc. CP/M has no access to any of this.

Writing the support for the 6120 side would be more practical though!

Nope, this is not the end of the line.

If however, anyone wants a copy of the source, let me know. I might
eventually put it up on internet, but it is an absolute dog to build,
and I don't want to have to provide support to people wishing to build
it, so I have been reluctant to do it.

William, you are correct, I was playing with RSX11-M long before the 8080 had CPM. Heck, I think I was just starting to play with RSX11-M about the time the 4004 just got released (cost me $800 to buy the damn chip, and I blew it up when my -5V regulator shorted out with some poor wire wrap).

>the whole computing world didn't start with unix or CP/M.

Yup, it started with Multics ... which begat the only true UNIX V6 (multiplexors anyone?)!

>and heck, PIP a problem, nayhh. in a way it was pretty neat...

Actually, if DOS is to be considered an operating system, then PIP could have been considered one all by itself as well, except for the nagging fact it could not `load' another program into memory ... ;-/

My favourite `program' under CPM was @.com, it was a zero length file, and *caused* the re-execution of what was already in memory ...

Speaking of which, does anyone have some documentation describing the protocol used between the Z80 and the 6120? I've only gotten about halfway through my disassembly of the Z80 BIOS (I keep getting distracted by other things), so I don't have much documented.

The orginal version of emacs was written exclusively in TECO. Arcane like
most software from that period, but you do anything in it. People did do
just about anything you could imagine in TECO. I won't confess to the some
of the things I wrote in TECO, but in those days you could tell the skilled,
from the unskilled by which editor they used.

>>>multitasking like RSX-11m, another CPM inspired OS.)
>>I don't recall RSX being particularly derived or inspired from CPM...

Sad how history can get rewritten by someone who thinks their
favorite OS was the first one in the world, especially considering

1/ The obvious 10-year chronoclasm between the emergence of RSX-11
and the emergence of CPM, and

2/ because CPM was a TOTALLY OBVIOUS port of OS8/PS8 from the PDP8,
since the names, command syntax, etc were identical. (Come on,
PIP, TECO (with another name,) ...)

3/ if you look at the Intel and motorola chip dynasties, you find

8088/80286/etc were early implementations of PDP8 micros, and
CPM-DOS etc looked much like OS8.

Motororola 6xxx series were modeled more on the PDP11, including
the hardware for good multitasking.

Most of the monstrosities of Windows, etc on the PC result from
building on the wrong foundation, that of a single-user computer
and system.

'nuff said.

I thought the same. Is the slushware included in the OS/278 source?

I need to modify the serial printer port driver so that it goes bidirectional.
(The radio TNC will go on the printer port and the SLIP will go on the
comm port.)

Alternately, I've a serious need for a 6120 disassembler and disk editor.

>Speaking of which, does anyone have some documentation describing the protocol

Makes two of us; I can probably get KA9Q with BIOS calls, if I get it going
at all, but using the 6120 I/O would make things more efficient and perhaps
even more interesting (!) as well...

Sad how history can get rewritten by someone who thinks their favorite micro was the first one in the world...

I don't know which PDP-8 programming manuals you've been reading, but no matter how much I squint and screw up my eyes I just can't seem to make any of the Intel line look even vaguely like a PDP-8. The SC/MP, now, that I can make look kind of like the PDP-8...

>some patience out there, please explain the theory behind it.

For pure two level FSK, the math is rather simple. Twice the shift plus the symbol rate in baud will give you a close enough estimate of the required bandwidth. Example: a 200 Hz shift and a 300 baud symbol rate gives a required bandwidth of about 700 Hz. MSK modulation does considerably better at 1.4 Hz per baud, giving you a bandwidth of 420 Hz for a 300 baud MSK transmission. Much better still for high data rates is a more complex modulation that encodes more than one bit per baud. QAM is one method.

>What is this leading to? Well, I understand the main limiting factor
>for using voice radios for high-speed data is the IF frequency bandwidth.
>Okay, so I want to investigate redesigning an IF strip to widen the
>bandwidth. What are the standard parameters?

Actually the main limitation is the phase shift across the passband of the filter, and poor discriminator linearity. This distorts the eye pattern and makes slice decisions problematic. Phase distortion can be reduced at the cost of gentler filter slopes, but that hurts adjacent channel rejection. Some schemes attempt to *pre-distort* the signal waveform to compensate for these non-linearities, but that presupposes known receiver characteristics on the other end of the link.

Trying to push high speed data through a modified voice radio is in general a poor way to go. It's much better to use a radio modem designed from the ground up for data service. It'll have optimized RF modulators and demodulators for the chosen modulation form, and it will have filters optimized for the service. And it will typically be cheaper than the voice radio you would have to otherwise modify. See the GRAPES 56kb RF modem for an example. (A RF modem *is* the radio. The GRAPES unit uses MSK to pass 56 kilobaud symbol rates through a 70 kHz channel.)

The Heath Z100 is in the same boat. There's fossil drivers for both of them.
I often thought that a fossil device in nos might be the answer. That is

"attach fossil...."

Having that, you'd be able to load the fossil TSR and let nos "talk" thru
it.

I'm not sure that alone would do it as there may be some video specific
stuff in some nos versions.

Clifton T. Sharp (clifto@indep1.chi.il.us) writes:

> Heck, _DOS_ came from CP/M. The guy who wrote it wanted a quick O/S
> and basically wrote a sort of a version of CP/M for 8086.

Back in the days when CP/M and the S-100 bus rules the microcomputing world, a company called Seattle Computer was having trouble moving its 8086-based single-board computer because it didn't run CP/M. In an attempt to improve its marketability, they had Tim Patterson, a staff engineer, write a simple loader and file system that they dubbed SB-86 (as in "single-board 8086") and gave it away with the board. Since CP/M was the de facto standard in that market at that time, SB-86 looked a lot like CP/M.

When Digital Research made the fatal mistake of trying to play hardball with IBM and fumbled the opportunity to provide the OS for the original IBM-PC, IBM turned to Microsoft, from whom they had aready licensed BASIC. Microsoft was into language products almost exclusively in those days, so Big Bill went down the street to Seattle COmputer and, without tipping his hand, bought both SB-86 and Tim Patterson for a song. Thus DOS 1.0 was born.

C. T. Nadovich (chris@kd3bj.uucp) writes:

> consider the list of similarities.... The list is pretty long. Many
> aspects of DOS 2.0 were inspired by unix

It was no coincidence that DOS 2.0 bore a striking resemblence to UNIX. Microsoft had developed a taste for operating systems, or rather the revenue they generated. Knowing that DOS was a toy, Microsoft's "strategic" OS when they released DOS 2.0 was XENIX, and they envisioned that one day the two would merge. That, of course, was before OS/2 became the strategic OS, which was before Windows became strategic OS, which was before NT became the strategic OS....

Microcomputing history buffs who want a real good laugh should try to dig up some of the Microsoft/IBM marketing propaganda that accompanied the first release of OS/2 and compare it to the current NT hype. The similarities are positively frightening!

The PDP8 (as well as DEC's PDP1, PDP4, PDP5 machines) were risc machines, or should I say MISC (minimal instruction set computer). Though they were limited to 32K (later we did a memory management unit for the PDP8/a to allow bank switching, which gave us 128K), one could be clever in writing programs to fit into 4K instruction and data pages.

OS8 was a derivitive of a disk based OS that was written for the 8 using the DF32 disk file (A fixed head 32K storage unit).

Later, there was an an augmentation to OS8 called RTS8. Richie Lary, who was on of DEC's PDP8 software gurus, wrote RTS8 for a special project.

If you have ever done a system build of OS8 to add a new handler, then you know you can really bone yourself if your not careful. Maybe someone with folklore would know the message " There is no hope, there is not TTY" means.

I am sure Roger I. has done a few builds :-)

The Harris 6120 implemented the PDP8 instruction set. DEC used it in 4
products: VT78, VT278, DECmate II and DECmate III

It also had a mode call panel mode. Panel mode allow you to create
"instructions", if you will, or subroutines to handle functions.

What's interesting is that DEC's current Alpha processor has a mode called
PALmode, which allows you to basically do the same thing....
(Alpha's PALmode is actually a decendant of EpiCode, which was used in a
canceled RISC machine that DEC was doing, until the politics got involved. The
cancelation prompted the departure of DEC's best OS and HW architects to

Microsoft. The end result is Windows NT.)

Can't say I noticed it particularly myself, and I jumped directly
from the one to the other. There was a microprocessor, name forgotten, that
did implement a PDP-8. The seismologists at Adelaide University used it for
their portable field seismometers -- I think the reason was that it was CMOS
and used a lot less power than the SC/MPs we were using in the Antarctic
Interferometer, so it could run a long time on batteries. Naturally, because
of the way the PDP-8 implements subroutine calls, they had the programme
stored in ROM but had to load it into RAM when booting.

Once I wrote a structured MACRO-11 formatter program entirely in TECO. It was an extremely powerful text processor, but so cryptic that if you put your program down for a day or two you couldn't pick it up and understand what you did! I still have a copy of TECO32 on my VAX, but haven't gone near it in years.

I have an MFJ 1270 (no suffix, one of their original boxes) that is upgraded with the version 1.2.9 EPROMs and extra RAM for mailbox support. Our BBS (using AA4RE software) forwards messages to my mailbox, but they get bounced back to the BBS because the forwarding flag is set to N on the incoming messages. A club member gave me his settings for his 1270C that gets its fowarding flag set to H from the same BBS (H I guess is for hold). I can't figure out any setting in the list that will do that for me. Does anyone have this setup working properly with a BBS?

Message-ID: <19941002.131047.53@goldhill.demon.co.uk>
Source record: 47205

Is there a (software) command with the latest Kantronics tnc software to reduce the load on the backup battery when the tnc is switched off ?

I ask because when I had such a battery in my KAM a while back, the command 'DAY 000000000000' did something similar, but this is not accepted with my KPC9612 nor a local's KPC4.

Noted that normally this feature would not be required but it is handy if going away for a while. Shame to have replace the battery, especially at UK prices :-(

Not quite. Most 1200bd amateur packet modems use chips such as the AM7910
and TCM3105 to produce audio tones which are (more often than not) fed to the
microphone input of an unmodified voice rig to produce AFSK (audio frequency
shift keying).

>What really makes me sick is that for 9600bps, people are still doing FSK
>and modifying the radio's to get a bigger bandwidth. (I believe this is the
>case)

Modems like the G3RUH use an eprom look up table to produce a waveform which
is not quite the simple squarewave produced by basic FSK modems. This waveform
is tailored to minimise the bandwidth of the transmitted signal by reducing
the amplitude of the signal's sidelobes. This allows the signal to (just
about) fit into a standard 25khz channel (at 9600). I don't know what class
this puts the 'RUH into (can it be described as a Gausian Minimum Shift Keying
modem?). Anyway, most rigs have to be modified for this signal as it can not
pass through the microphone audio filters without being severely mangled (most
mods seem to involve bypassing this stage and putting audio straight across
the varicap diode). Some rigs also need modifications to the PLL loop filter
to inprove the TX LF audio response. Also, at the receive end it is sometimes
necessary to use an IF filter with a flatter passband and phase change which
does not vary too much with frequency (since such filters can be expensive and
difficult to get hold of, it is common to use wider filters or to reduce the
number of filters cascaded together, though this will naturally degrade the
adjacent channel selectivity).

> To calculate some of this, I need to know the typical ballpark

I don't really understand this. When we talk about FM signals, we normally
talk about the maximum transmitted bandwidth (which depends on the channel
spacing used), whereas the 4khz you are quoting for the phone line is the
audio bandwidth. Basically, you must decide what channel spacing your system is

designed to operate with. I guess you'd ideally be looking for a system which would operate in a 12.5khz cannel (+/-3khz Peak deviation), though maybe 20khz (US) or 25khz (most other places) would be ok (+/-5 khz peak deviation).

>the transmitter EVERY time you want to transmit data, and the writing of the
>software, which I can take care of (hopefully). Can anyone think of
>another problem that would sink this idea?

My only worry would be finding fast enough DSPs which were affordable (though as you say DSP has massive potential benefits). I think that at this speed it might be worth looking at modifying the AX25 packet standard to make it more like the X25 "wired" standard. The restrictions on maximum packet length in particular are entirely innapropriate as they mean that the transceivers will probably spend more time TX/RX switching than sending/receiving data.

These are just my thoughts after quickly reading through your message. I appologise if they are a little garbled, but I'm a bit short of time. I'll leave it to others with more experience in this area to further clarify things when they get back to their machines tommorow.

Live long and prosper,

Rob.

> First of all, most of the packet modems aout there do FSK at 1200bps.

Actually they use AFSK through an FM voice radio. A horrible waste of bandwidth. IE the FSK is done at *audio*, with a 1000 Hz shift between two audio tones, and this is transmitted "faithfully" as Bell 202 *audio* over an FM voice radio. It's *not* ordinary FSK over the air, and occupies about 11.2 kHz of bandwidth. If SSB transmitters were used, it would closely *mimic* wide shift FSK up to the carrier and sideband suppression limits of the radio. In fact, that's the way FSK is typically done at HF, occupying about 700 Hz for a 300 baud signal with a 200 Hz shift.

>What really makes me sick is that for 9600bps, people are still doing FSK
>and modifying the radio's to get a bigger bandwidth. (I believe this is the
>case)

9600 baud is done with a predistorted audio signal that generates a modified FSK waveform when fed through a FM voice radio bypassing the audio stages. It *is* FSK on the air, done in a somewhat peculiar fashion. It occupies about 19.6 kHz of bandwidth.

>Because FSK only uses two levels of representation, why can't we use
>some other type of system that will give us multiple levels of encoding.
>So with the same bandwidth, we could get "more" information.

We can, of course, but we need a better SNR to do that. Shannon won't give us a free ride. Note that for the two modulation schemes above, amateur receivers throw away significant parts of the modulation energy, so they don't represent optimum Shannon limit signals.

> To calculate some of this, I need to know the typical ballpark
>Signal to Noise (S/N) ratio for a two meter FM with full quieting audio
>signal. I also need to know the bandwidth, however, I probably can assume that

>confident that it is better than the 4khz of a phone line (The phone co
>guarantees 30db s/n)

Full quieting is a somewhat vague term. In amateur FM practice it typically means either a 12 db SNR, given in manufacturer specs, or a 20 db SNR including the effects of FM capture. The usable FM voice passband is between roughly 200-3200 Hz, but that passband is typically a far from flat frequency response. Some radios have

very marked humps in the passband, and almost all have serious phase distortion near the passband edges. When you throw in multipath, it's much more hostile than the telephone environment.

>The other problem that we might have is syncronization
>of the signal. Since we are dealing with a half duplex channel, this could be
>a serious problem, however there are ways to get around this. Even if you
>couldn't get around the sync problem, the modem would still work well for
>Full duplex channels. This would be great for the backbone network at least.

Synchronization and training would be needed to establish such a link, but that ignores the fact that packet is not typically a point to point service. It's a multipoint to multipoint burst scheme. The signal from any given transmitter has to be decodable on *every* receiver out there on channel so they can recognize when a packet is addressed to them. Since every model of radio has a different frequency/phase response, training is singularly ineffective.

> I would implement most of the signal processing in a TI dsp chip. This
>would make the modems kind of expensive, But definately worth it! However the
>chip count would be low. AND (a BIG and) you could change the software
>and speed the modem up without buying a NEW modem. We could also be

>
> Other than the problems of S/N ratio, and the receiver syncing on
>the transmitter EVERY time you want to transmit data, and the writing of the
>software, which I can take care of (hopefully). Can anyone think of
>another problem that would sink this idea?

Yeah, as mentioned above, training is ineffective because all receivers on channel must be able to decode packets from every transmitter on the channel in order to determine if the packet is addressed to *them*. This means training can't be used, and that self synchronized signalling is required. Phone systems get around this problem because addressing is handled separately by the phone system, IE if the phone rings, the modem knows the data stream is addressed *exclusively* to it and can start a training sequence to optimize the particular link.

The problem is trying to force complex digital signals through voice radios not designed or optimized for that service. Any attempts to do so are doomed by the myriad of different models of radio out there, each with it's unique responses. You have to get over, and discard, the idea of using FM voice radios for high speed packet data. They are not *at all* like the telephone network. Instead you have to have purpose designed *RF* modems that *are* the radio as well as the more mundane bit and clock recovery elements of the system. Since a purpose built RF modem can be optimized for the particular encoding scheme used, no training is required. The GRAPES 56kb RF modem is such a system.

The GRAPES RF modem uses a form of MSK to fit 56 kb data streams into a 70 kHz channel. However, if more SNR were available, similar systems could use bandlimited multi-level QAM to fit even more data into the

spectrum available. Multipath remains a serious problem for complex signalling schemes, however, and spread spectrum techniques may be required to cope with very high bit per baud encodings on the radio channel.

Sorry to rain on your parade, but others have been down the path you want to take before you, and it doesn't work. Adapting high speed telephone modem techniques to multipoint to multipoint radio systems is a lost cause. The problems of packet radio are *different* from those of the telephone network, and require different solutions.

I connected my KPC-3 to a Kenwood Handheld with no problems. The diagrams in the included books are pretty good and should help. Incidently, the wiring for my radio included a small capacitor. I stole it from a dead piece of euqiptment and hid it inside the connector. Yours might require a resistor. Radio Shack helps alot, here, for you have to make your own connectors for the radio-end of the cable.

Mail me if you need more info.

3418. MC13055 and other stories...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-02 21:29:07 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <15583@uugate.wa7slg.ampr.org>
Source record: 47212

I keep seeing pleas for information on getting MC13055 chips.

A year or so ago, there *were* available, but it seems as though they are on "permanant allocation", or they have delivery dates in the far future. There are three solutions:
1) Look in more places. Someone is bound to have some in stock, somewhere, or find a contact at a place that uses them in a product. I have no ideas on the latter, so don't ask.
2) Order now. You'll likely get them... eventually. Order a bunch, you KNOW that you can sell the excess...:-)
3) Improvise.

I'll comment on the latter.

What is an MC13055, anyway? It has the following stages:

1) RF-Amp
2) Limiter with RSSI (Received Signal Strength Indicator)
3) Quadrature Detector (i.e. Discriminator...)
4) High-speed comparator, gated by another comparator from the RSSI.

I need not point out that each of these things are commonly available in other ways. For example, the first 3 are to be found in an NE604, for example. However, it doesn't operate at as high a frequency as the '13055. So, simply lower your IF! The high-speed comparator could be an LM311, for example, although there are other choices as well.

All of the above could be found in the MC3356. This may be slightly more "findable". It is like the MC13055 except that it has a lower IF frequency, single-ended discriminator (instead of differential) and it also includes an oscillator/mixer combination. It is rated for 500 kbaud, but it can likely be pushed higher. I haven't tried pushing the '3356 myself, though...

The above has its price, though. It may involve (GASP!) the designing of a NEW and DIFFERENT board!!! (scream, panic, foreboding, etc...)

I might point out that, as an example, the 2 mbaud link (the one often mention... the one from Ham Radio Magazine that is/was in the ARRL Radio Amateur's Handbook) is ***NOT*** a full-duplex link.

Stated another way, FULL-DUPLEX it is NOT!

(Well, ok, the orderwire *is* full-duplex... but not the data...)

This is obvious, since a Gunn transceiver uses its oscillator not only for transmit, but as its own LO, therefore what you transmit is also received on your own receiver. Unless you have some means of removing it (as in some means of analog-based cancellation of the transmitted signal in an

earlier stage) it will not be useable as full-duplex. This is normally not a problem, since the boards to which it was originally interfaced weren't full-duplex, either... Keep in mind that, as far as the FCC is concerned, any automatic packet system must use ax.25, and these boards don't do it. I guess one could take the "who will know?" approach...

Just a few thoughts...

<Clint>

ka7oei@uugate.wa7slg.ampr.org.

The KPC 3 can be upgraded in memory as well..

> It also appears to allow for automatic mail
>download from your PBBS without any intervention from the
>PBBS sysop.

There is a bug in the MFJ forwarding software in that it makes some systems think that the MFJ personal mailbox is a full fledged BBS.. This often causes systems to lose mail.. The problem is in the forwarding line that the MFJ adds to the message body.

I also understand that the KPC will have the same capability very shortly, but not with the same bug as the MFJ I hope.

>But some of my friemds claim that MFJ is no good, never works,
>never works for long, etc. etc. Is this true or is it rather
>a bad case of MFJ bashing?

The MFJ is good for the following reasons

1.

I have a KPC-9612 I need to wire to my HTX-202 (for 1200 baud) as well.
I'm assuming the wiring diagrams are pretty much the same as for the KPC-3.

I've wired up the speaker jack, but am a bit confused by what my manual
shows for the microphone jack. I'm looking at the diagram they show for the
ICOM 2AT since I've heard the HTX-202 is based on this radio. The diagram
for the mic jack shows pin 3 of the KPC's DB-9 port connected to the tip
of the jack with a resistor in-line and pin 1 connected to the tip with a
capacitor in-line. There is no indication of a connection to the sleeve of
the jack. The diagrams for other radios given show pin 6 (ground) connected
to the sleeve. Is this an error in the ICOM diagram or is this correct for
this radio. _AND_ does this also apply for the HTX-202?

Thanks.

Is there a maillist or mailgroup or ftp-site related to the
use and/or development of WNOS? I've got it working, and like it,
but it only talks POP2 proptocol. To be more compatible with the
rest of our network, POP3 would be nice.

Thanks for any replies

3424. From FBB to TCP/IP ?NOS solution.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-03 05:56:26 UTC
From: filip@ppnway.ping.dk
Message-ID: <781163786.2snx@ppnway.ping.dk>
Source record: 47227

- I have some questions related to JNOS, because I like to replace a running fbb-bbs installation with a tcp/ip nos solution and later do a switch from dos to maybe linux. But It's not easy to brake old habbits :-)

- First I must say after running fbb-bbs a long time and makeing tools and small online programs,cfilter,mfilters, message servers and etc, I get almost dependent on this great fbb program :-). Maybe that explains why this fbb bbs software is a very commen solution in europe and the usage of local tcp/ip radio activity is maybe limited.

Data-compression on mail forward and phone modem support with commen protocols like x/Zmodem does also make it a nice solution with FBB in some cases. Anyway bulletin distribution of mail areas on a FBB is limited, even if we localy have made usage of (G PPN###) in forward files to make maybe 000-999 news-chanals assigned to local area interrest groups and where a forward is done on subjects. No swapping is needed or recommend but a PG SEND program can put new mail in the right PPN### distribution chanal depending on keywords. The usage of selective distribution is very easy and (! G PPN010) or (G PPN0##) is nice to have.

- All this is only done, because it's not possible to use maybe (G radio.digital.*) on FBB 5.15C. But then it should be possible on a tcp/ip JNOS solution with smtp/nntp ?

- Anyway I have a JNOS 1.10F but for some reason the ppp protocol were missing and the NNTP was not included, but something called POP3 was included ?

A first time nos installation from the beginning is not easy with all the very drifferent unknown nos versions were some parts are missing. So I have to find a solution/compilation some where, with ppp was implemented also, can you help me?

By the way is it possible to do forward between a fbb-bbs and jnos via PSTN/Modem connections also?

I am running DOS and I also have Turbo-C 2.0 and have a limited C know-how, but is it possible to compile jnos 1.10 with using the turbo-c 2.0 compiler ?

My plans is to install linux later makes the jnos tcp/ip packet solution looking even more fun as fbb may not be available for linux anyway and it's fun with alternative

solutions also. I understand that usage of mail-compression on forward etc. like on the FBB is also commen now on tcp/ip packet mailbox solution even netrom support is part of jnos, so it is a much interresting solution.

I have two AEA PK88 modems and a ZyXEL modem on a 486/8mb with NE2000 connnected to another pc. where disk resources etc. should be possible shared via a (tcp/ip peer to peer) link solution.

I welcome any advise or suggestions going from the fbb to a tcp/ip compatible solution on packetradio.

Not to thwart the ham-spirit - But - if you would like a all ready made
cable, MFJ makes a whole slew of them. I use the kpc-3 with my htx-202
and it works great. Made my first cable like the book said, but later
bought a pre-made one from Tucker Electronics. Gud look and 73 - Bill, kd5lu.

3427. Is there a cheap 1200baud link out there?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-03 11:09:52 UTC
From: southagr@caedm.et.byu.edu
Message-ID: <southagr.5.006D50B7@caedm.et.byu.edu>
Source record: 47220

I am looking for a low cost solution to radio linking low speed serial data. 1200 baud is fine, slower might be ok. I want to transmit from a metering station to an IBM about 1/2 to 2 miles away. I know that running cable would be simpler, but isn't very practical in my case.
I am looking into building my own Tx/Rcv pair, probably with the NE605, or MC3367 Rcvr, and a cookbook Tx, but since my experience is more in digital and less in radio, I'm having trouble rounding up the pieces the app. notes example circuits recomend. Digi-Key, Mouser etc. just don't seem to "do" radio. If someone has built such a pair, or if such is commercially available, I'd like to purchase rather than build. Alternatively, source recomendations (for the coils, filters etc.), proven schematics, advise, etc. would be very helpful.
Also, I've read chunks of CFR 47, and get the impression that 49Mhz would be the easiest freq. to deal with, but I would like to get my hands on a layman's guide to the subject. Does the ARRL publish anything specific to my type of project?
Thanks in advance,
Gordon Southam

Source record: 47218

I have seen wiring diagrams for this application in a back issue of 73 AMateur Radio. The pin outs (I am almost positive)are the same as an Alinco DJ-580. You can call any of the mail order places and they can tell you how this is done. Pin 3 is not used. I have an Alinco DJ-162TD and it has the same pinouts. If anyone would like the exact issue I could find it in my library of junk.

I have exactly this setup. Make the cable as indicated for an Icom or
Yaesu handheld. Forget the capacitor and resistor and use the internal
components of the KPC. To do this set the jumper as the owner's
manual indicates. If the HTX-202 will not key change the keying
resistor in the KPC to 2.5k Ohms. This is well down from what was
in there but it works properly. This setup works with my HTX-202 a
Yaesu FT-530 and an Icom 2iA. I don't remember the keying resistor
component number but it is near the back of the board and well
documented in the manual.

3432. Re: Maillist for WNOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-03 14:25:48 UTC
From: fernando@edugraf.ufsc.BR
Message-ID: <199410031426.LAA14970@desterro.edugraf.ufsc.br>
Source record: 47219

From Mark Ellis:
>Is there a maillist or mailgroup or ftp-site related to the
>use and/or development of WNOS?

You could get in touch with all Wnos developers joining the distribution
list WNOS-L

To subscribe, just send a mail to:

ListProc@edugraf.ufsc.br

with content:

SUBSCRIBE WNOS-L <your name>

Please ask there for pop3 (sure the guys will do the job ;-)

The good news about wnos:

- no more memory leaks
- IP access is coming soon (thanks to barry tittmars)

about sites:

- ftp.edugraf.ufsc.br - last week, brazilian's science&technology
ministry announced that Florianopolis (ufsc) will be linked to the brand new 2 megabits
backbone. Then it will be better to get wnos stuff (two
months, people said).

- ftp.ucsd.edu - there are the last exes produced by barry:

hamradio/packet/tcpip/incoming/wnos-9408xx.exe

73!

Be sure to check out TAPR's new platform, the DSP-93. No sense reinventing
the wheel. I wonder if it's fast enough to implement a 56kbps scheme?

>

I remember reading somewhere that the present state of the art in modem
design approaches something like 80% of Shannon's theoretical maximum.
It would be interesting to see the numbers that you come up with for
just what the maximum *is* for an amateur VHF channel. Achieving the
state of the art is, of course, another matter.

|>
|> Thanks in advance for any/all replies.

It is like the kpc4 in that it has two ports you can use at
the same time, like the kpc-3 in that it is small and low
power. One port runs at 1200, the other at 9600.

We have quite a few of them in our network already, and
they work great!

|> What is the net wisdom?
|>
|> Greg

kpc-9612 at roughly US $200 or a little less gives you both
options - one port runs 1200, the other port runs 9600.
You can use both ports at the same time.

>
This is basically what the Pacsat protocol does - someone asks for a
file which is duly sent as a set of blocks. Anyone missing particular
blocks can then request retransmission of those blocks, so minimising
the amount of bandwidth needed.

Back down to Earth, I believe that at least one TNC manufacturer had
firmware which would collect all the packets from a station and sort
them into order as well as it could.

You can FTP XPCOM from the following site.

ftp.indirect.com

directory pub/software/msdos/hamradio/xpware

The following files are available..

XPCOM153.ZIP

MFJ-1278
AEA PK88 or PK232 (host mode)

XPKAM153.ZIP

Kantronics All Mode Version 6.0 or higher
firmware. Host Mode

XPDU152.ZIP

AEA PK900 or DSP2232

These programs support all current available modes on these TNCs.

From: rgm@bilbo.baylor.edu
Message-ID: <36ppe4INNjhq@BUDS1.baylor.edu>
Source record: 47228

<SNIP>
: : Hate to tell you, but the *only* mud code you're going to find is for
: : TCP/IP. Though there is one that works over Appletalk on the Mac, I
: : guess (hadn't thought about that). You're either going to switch over
: : to TCP/IP (easy) or totally rewrite the MUD driver (not so easy).

<SNIP>

On a similar note - what about running a MUD over packet (using a standard TNC) and using NOS as the TCP/IP driver?. Add to this mess the further complication that all of this is operating under OS/2 2.1.

ie: I'm running OS/2 2.1 on a 486-33. I'm planning on setting up a packet station using NOS for OS/2. There is a mud that has been compiled for OS/2 out there - CircleMud, I believe. Is it possible to make the Mud and NOS and OS/2 all get along and function properly?
Thanks

Intersil made the IM6100, the original PDP/8 micro. (Harris made copies of this with varyng configurations.) I still have an old Intersil development board around. It's main claim to fame: low power CMOS design, while most microcomputers of the time were still pretty power hungry.

Ross G. Miller (rgm@bilbo.baylor.edu) wrote:
: On a similar note - what about running a MUD over packet (using a standard
: TNC) and using NOS as the TCP/IP driver?. Add to this mess the further
: complication that all of this is operating under OS/2 2.1.

: ie: I'm running OS/2 2.1 on a 486-33. I'm planning on setting up a packet
: station using NOS for OS/2. There is a mud that has been compiled for
: OS/2 out there - CircleMud, I believe. Is it possible to make the Mud and
: NOS and OS/2 all get along and function properly?
: Thanks

If you can get the NOS system to talk to it, then sure. I have no idea how it's setup to run under OS/2 and to talk to other systems. If it uses TCP/IP under OS/2 (not NOS either) then you just need a way to have NOS talk to that. Basically NOS should be setup as a front end to the OS/2 box. If OS/2 has TCP/IP installed then just give it an address and people can then telnet right into the MUD game. If the user is running just plain AX.25 then it's a bit more complicated. A kludge would be for the user to connect to the NOS system and then do a telnet to the MUD from the mailbox. As I mentioned in a previous message, this is very slow and doesn't work very well. A better way would be to get a connection redirector put into the NOS code to redirect one incoming protocol connect to another one. For example, you define an incoming AX.25 connect to actually do a telnet to another system and port number. Code for this exists for KA9Q base code and also for JNOS, but it's not in the release for JNOS at the moment (and I don't have the code handy either for JNOS but I have the patches for Phil's code somewhere). Can't say about NOS for OS/2 though.

Bascially what I do at home now is run Linux with both AX.25 in the kernel and JNOS/Linux. JNOS runs the low speed 1200 stuff better, that's why it's installed. Plus it's easier for a regular packet person to understand when they see a NOS mailbox. The Linux side though is talking to the JNOS via a pty (psuedo tty) using SLIP and anyone can just telnet to any application running under the Linux side. The Linux is also published on the JNOS too so they don't even have to know to route via it since the JNOS will answer for incoming Linux packets over the air. I fired up a MUD a while back over packet just to goof around with and found that NOS didn't like some of it due to some terminal emulation that was required. When a local connects using Linux it works great, when using NOS some verions chopped over the first character of each line and some lines were double spaced. Trying to go through the JNOS mailbox on Linux was also a waste of time since that worked pretty badly.

If you wanted to do incoming AX.25 connects to
a MUD on a Linux system, install the AX.25 in the kernel and just modify

the souce for the axl AX.25 listener program to run the MUD. I've done this for other applications and it's worked so far, but havn't tried it for a MUD to see if it works yet. Maybe I'll give it a whirl just out of curiosity.

Don't be too fast to dismiss this idea. One of the things packet networking
desperately needs is a cheap high speed data link. This is necessary for
operating a cellular packet concept. It would only have to work with the
radio on the other end, so adapting would not be out of the question. If
the price of a link could come down to about $600, I would be very interested.

I really liked RSX too. You are right, I got it backwards: PIP and comon
separated devices came FROM RSX.

>And PIP was cool!

I kinda' like copy (or cp) myself.

>Wow, to think we used to have multiuser development systems
>running on 16bit machines with 248KB of main memory!

This was truely an achievement. By comparison, DOS, running on a bigger
better machine, is still far behind the capabilities of RSX.

It's as if all OS development ground to a halt somewhere around 1980.
It's only now we are seeing some new OS concepts being fielded.

To the best of my knowledge, phase 3d is *not* geostationary. It's hard to
get world wide funding for a bird in geosynchronous orbit since it would
only cover a portion of one hemisphere.

3446. High speed packet help needed!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-04 02:27:23 UTC
From: au659@yfn.ysu.edu
Message-ID: <36qeib$fta@news.ysu.edu>
Source record: 47235

Hello! I've been trying to set up several local (ie very low power) high speed data (hopefully > 9600) links as the hopefull beginning of a high speed TCP/IP subnet in my area (Western Mass). However, I've been off of packet for a long time (ever since my last station was downed from massive equipment failure) and I'm willing to bet that a lot has changed in that time.

I would very much appreciate it if anyone could give me some pointers on what radios/modems/bands I should consider! At this point, we'll probably be starting out with a single point to point link, but at some point we'd like to add more nodes, either with another point to point link, or using one LAN frequency.

Any and all help and advice will be appreciated!

Chris

Having the same problem, Jim. The two responses I've gotten indicate that
you must use a TNC with a cpu operating at 4.9Mhz or above. One fellow
indicates that he switchet to 10mhz and the problem disappeared. The other
solution was to use a DCD board which you already seem to have.

Please post any other solutions you may hear of. Thanks & 73,

I have just fetched paket61.zip from the above mentioned address
and installed it on my machine. It looks great, but during installation
I gave my TNC as MFJ1270, and the installation program failed to
find the help file for this TNC. The read.me file says:

This version includes eleven different TNC Help files, many of which were
supplied by paKet users. Thanks to those who have produced these
additional Help files for their TNCs. I know all users of those TNCs will
appreciate your efforts:

Help File Description Created by

DSP-12.HLP for the DSP-12 Carl VK2JJM

KAM.HLP for the Kantronics range Col VK2KQX
especially for the KAM updated by
Andy VK4WAC

KPC-3.HLP for the Kantronics KPC-3 Carl KG0HS

MFJ1270.HLP for the MFJ 1270B and Philip ZL3GP
(new in 6.1) the MFJ-1274

PK-88.HLP for the AEA PK-88 Jim G6FCL

TINY231.HLP for the TINY-2 with firmware Stan G4EGH
versions 3.0 or 3.1

TNC1.HLP for the original TNC-1 Norm VK2XCI

The distribution on FTP.FUNET.FI has only ten help files and the
MFJ1270.HLP is missing. Anybody known where to get the missing file?

Well then you need a GRAPES 56kb RF modem. It's $250, and with the
necessary transverter and digital interface, it's still under $600.
Most of the voice radios being used for 1200 baud packet cost nearly
that much. 46 times the throughput for about the same money is an
unbeatable deal.

> Gordon Southam
> southagr@caedm.et.byu.edu

Since you've read CFR47, Pt15 you should by now be aware ofthe power and
antenna limitations imposed in the 49 MHz band, and also that your proposed
device MUST be type-accepted by the FCC before you can legally operate it
on the air. 49 MHz is NOT an experimenter's band!

If you've tried to make a cordless phone talk two miles you'll have already
verified that the signal is not strong enough to overcome the path losses
and environmental interference in this frequency window. On the other
hand, if you haven't looked at the path and need a quick test setup, try
that hardware before you invest any hard cash and development time into
your project.

There are many standard commercial units on the market which will fulfill
your needs. Some even go up to 9600 baud and are made in the USA, but this
is NOT a commercial. Even the US Department of Defense is now required to
buy "off-the-shelf" rather than going custom and creating the $600 hammer.
There are several slogans that apply to your situation, including "Support
the economy," "Buy American," "Just do it," and "Don't re-invent the
wheel."

Try to install ax25 v0.24 driver in your kernel. You can found it with
ftp at sunacm.swan.ac.uk:/pub/Linux/Radio

After that, you can do TCP/IP with all Linux standards commands (like telnet
ftp), and ax25, in the same time...

I'm going to write with this driver an application to accept fbb forward
connection... Is someone here have already does that before begin
anything ?!

From what I've heard there isn't a ealisy available transverter that works
reliably with the GRAPES hardware.

How much work is it to put one of these systems together? I'd be intersted in
running something like this, but its hardly what you could call
"plug and play"...

>
>How much work is it to put one of these systems together? I'd be intersted in
>running something like this, but its hardly what you could call
>"plug and play"...

I'm quite interested in building a couple of these puppies for a very
short (ie low power link), but I too have not been able to scrounge up much
information on what other people have done with these modems.. Any ideas
how much a very low power output transverter would cost that would work with
this modem? I'm planning on using fairly directional antennas, and the two
links are about 3/4 mile and 2 miles long -- almost literally line of sight.

Any help appreciated!

Not really. Multipath and such are impediments to any modulation scheme that
relies on phase information, such as QAM but it can still be workable.
,
I think what needs to happen is for us to adopt a standard for high speed
packet over standard bandwidth channels. With *very* little effort, 19.2 is
more than possible, and probabily 38.4 without too much trouble at all. Of
course multipath and fading will kill it :-) who cares? for local stuff,
I'll live with that, and the high speed backbone links can stay ugly low
tech FSK (that went out with the 1970, IMHO).

Another thing we need to realize is that $600 is just plain silly, and far
out ot reach of the end user. It's got to be $150 and use you hand held.
All very do-able, but there are lots of issues to consider for the hardware.
It would take a good throughput DSP and a medium speed microcontroller.
How about that new chip Motorola just announced, the one with a 68020, 56002,
and a small RISC timing engine for around $70? That would give us enough
DSP throughput to handle the modem (but I don't think there would be tons 'o
free time left, though) and a good CISC machine to put some kind of OS on to
handle packet switching / routing. Food for thought..... (Well, actually,
it's kind of a way way way back burner project.....)

Ok, some of these acronyms are familiar:

MUD = Multi User Dungeon.
BBS = Bulletin Board System.

And some are not:

DOOR = ?

Or is that not an acronym?

Is a game not derived from the classic "Dungeons and Dragons",
and which supports multiple users called a "MUG" ?

3465. Radio Show Exchange using Maven

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-05 02:20:52 UTC
From: peterson@sun.lclark.edu
Message-ID: <36t2i4$s7t@sun.lclark.edu>
Source record: 47157

My college radio station is looking to exchange radio programs (1 hour) over the internet with other colleges using Maven. We have a Mac on an ethernet network connected to our broadcasting board. We have tried sending an on-air broadcast to different Macintoshes around campus and it seems to work pretty well.

Basically, all you need is a line-level signal from your broadcast booth into a Macintosh on a network capable of accessing the internet.

It does take up quite a bit of band-width, so the broadcasts will have to be late at night. Right now I am interested in running a few short tests to study sound quality. Is anyone interested.

Please contact me via e-mail at peterson@lclark.edu.

Thanks,
Leland Peterson,
Music Director,
KLC Radio

PS Credit for this idea goes to a guy named Paul that works at the station.

IMHO any attempt to get speed more than 9600 on HandHeld or other 'voice'
Radio is problem. Even if we find new modulation. With half-duplex
delay time for TX/RX switch, PLL lock is long - try compare time of packets
on 9600 and time for delay. Our line will be not productive. On 9600 we have:

RR frame about 20bytes (20*8bit) * (1/9600) is ~ 17mc
256 byte Info frame is (256*8) * (1/9600) is ~ 200mc

And delay 200-300mc for usual radio. Even with 100mc it's not very good.
Here I not calculate any multiple of modulation - difference
between speed of transmit and "linear-modulation" speed for QAM, TCM
or other like with more than two vector of modulation.

You can to find some in review of fast Hams modem by VE3JF:

Equipment Options for Medium to High-Speed Packet

Compiled by Barry McLarnon, VE3JF

Last update: 28 July 94

there 9600, 19200, 56k, 250k and even a little about T1.

If however main look use it with halfduplex usual radio.
What about FX589 GMSK chip, it's lower-power chip which can handle
4Kb to 40Kb. Such modulation used in "Cellular Digital Packet Data"
in M-ESs "Mobile End Station" network. IMHO it can be some cheap and simple -
8000bps modem than g3ruh. (more speed required more bandwidth for
gmsk: 9600 - 25Khz channel spacing, 19200 - 50Khz, that can be use
on more high bands).
But in Radio Channel Requirement description I find only a few words
about Radio. Not sure that any Amateur Radio can be use.

>"plug and play"...

True, it's not "plug and play". It takes me about two evenings to
assemble the boards, and another to harness them together and mount
them in a box. It takes about 10 minutes to tune one up. After that
you go looking for transverters. The Microwave Modules units work
great, but since they are discontinued, you have to scrounge for
them at hamfests. I've found at least one at every major hamfest
I've attended, however. The SSB Electronics transverters also
work, though you have to do a small modification to separate the
28 MHz input and output. You want a transverter with separate
in and out on the 28 MHz side, and switching on the antenna side.
The MMTs are made that way, the SSB units are the reverse. It's
fairly easy to fix that, however. The big problem with the SSB
Electronics units is that they are *expensive* if bought new.
Another choice is the Down East Microwave transverters. They
work, and aren't very expensive. As a last resort, you can use
the Hamtronics XV4 and a receiving converter. That's cheap,
and it works if you've got good signal levels. It isn't exactly
high performance RF, however.

Gary

>on the air. 49 MHz is NOT an experimenter's band!

I think Karl is a little mistaken here; part 15 certainly allows low
power experimentation on several bands, including 49MHz. In fact,
without a copy of the CFR in front of me, I recall the limit on power
is actually quite a bit higher for homebuilt devices (i.e. not from a kit).
Furthermore, there is no type acceptance requirement for such experimental
devices. Things like the 1750 meter band are authorized in Part 15.

I could be mistaken, but I doubt it. I'll have a look at Part 15 as
soon as I get a chance. Maybe Karl has a copy close by?

3472. continuous data transfer over +/- 2 miles

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-05 18:11:16 UTC
From: stephenh@autonomous.com
Message-ID: <stephenh.34.002C746A@autonomous.com>
Source record: 47165

I need to send a continuous data stream at about 1200 baud over a distance of about 2 miles.

I am trying to instrument an amateur race car and send real time telemetry back to the pits. I am a total novice on this, but someone told me packet radio would be a way to go. After reading the FAQ, I don't think that this is so, rather, I think I need some other form of digital transmission...

Any ideas ???

3473. Windows software for Kantronics Kam+

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-05 18:20:46 UTC
From: sem2r@galen.med.Virginia.EDU
Message-ID: <Cx7pMM.BvH@murdoch.acc.Virginia.EDU>
Source record: 47163

I just got back into hamming after a 15 yr. hiatus and got a Kantronic Kam+ for packet + CW, RTTY and other digital HF modes. I prefer Windows-based software, which to my knowledge, Kantronics does not currently make. I believe that AEA does make a Windows-based program for their controllers. Will it work with the Kantronics units? Are there other Windows-based programs that will do the job with little or no configuration changes? Will some of the multifunction ham programs for logging and transceiver control like HamWindows do the job?

Please reply direct to: Stacey E. Mills /WB4QKT
sem2r@galen.med.virginia.edu

Many thanks!!

At this point in time, we should aim much, much higher than
19200. I've read at least a couple of papers over the past year
describing 80-128 kbps modems implemented in fairly slow DSP. IMO,
any interesting, modern application, say talking head teleconferencing,
wants 100 kbit/sec or more BW delivered to the user. We should be
aiming for a few mbit/sec per channel, and at least 256 kbit/sec
delivered to the user.

: Another thing we need to realize is that $600 is just plain silly, and far
: out ot reach of the end user. It's got to be $150 and use you hand held.

: handle packet switching / routing. Food for thought..... (Well, actually,
: it's kind of a way way way back burner project.....)

At least initially, price would not matter. People who really need
high speed (eg backbones) can pay more. As the technology percolates
down towards the user, costs will drop.

Perhaps the most important aspect of developing new modems is to have the stuff available off the shelf. In these days of surface mounted components, it is simply impractical to have people stuff a board with fine pitch 208 pin PQFP's using their Radio Shack 40 watt iron....

3475. Re: HTX-202 to TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-05 20:01:24 UTC
From: dara@physics.att.com
Message-ID: <Cx7uAD.9o2@nntpa.cb.att.com>
Source record: 47170

I have an HTX 202 connected to a KAM for packet. The KAM
manual gives instructions for an ICOM 2AT and also a Yaesu.
The difference between these is that the ICOM requires a
3.9 K resistor in series with the PTT line and Yaesu requires
2.2 K. The HTX 202 must be wired with a 2.2 K resistor which
is the same as YAESU. I don't remember the capacitor
recommended in series with the tnc audio to the HT. Both
the resistor and the capacitor are connected to the connector
tip. You don't need the ring if you use a stereo connector.
The sleeve is ground.

1200 bps packet will not achieve 1200 bps data throughput. The protocols
are designed for reliability, general addressing, and packet switching
through multiple networks, etc. In your case, depending on the reliability
you require and assuming you want only point to point communication, you
might get by with continuously modulating your data stream at 1200 bps
using one of the common modem configurations, and demodulating at the
receiver without AX.25 or tcp/ip protocols. Probably you would want to
include synchronizing and checksum bits.

Okay so I've heard the question asked a couple times .... it
must be a FAQ by now.

Q: Where do I get info about how much it costs and where
to get bits to do hisgh speed data?

A:
ftp: hydra.carleton.ca/pub/hamradio/packet/hispeed.006
or if you're more inclined to use WWW:
http://hydra.carleton.ca/articles/hispeed.html

It more than proves the point that the bits/$$ is
much better with 56k!

The Central Vermont Amateur Radio Club is in the process of establishing
a node on Lincoln Peak in the Green Mountain National forest in Warren
Vermont. We have "heard" that from Lincoln peak on a clear day,
downtown Montreal office buildings have been spotted. One person who
has done "curvature studies" says it's not possible.
We would like to conduct an experiment with interested Canadian packeteers
(this weekend if possible) October 8 or 9 to see if such a far-reach
node could be implemented.
If you or your packet group in interested in this please contact me
via telephone at 802-223-1234 immediately. Time is of the essence, as the
peak will be snowed in any day now, and the research would have to
wait until late spring.

The Peak is 3486 feet above sea level and is at
Latitude North 44-08-25
Longitude West 72-56-03

Tests would include cellular phone, amateur phone, and good telescopes
(if the weather permits)

3489. Telecommunications Conference

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-06 14:56:44 UTC
From: Richardm@psrc.wa.com
Message-ID: <540NWPMHLXLCBBJPJ@psrc.wa.com>
Source record: 47090

The Puget Sound Regional Council is hosting a day-long conference on the implications of telecommunication technoplogies for transportation, growth managementand the economy in the central Puget Sound region. The conference will be January 6, 1995, at the Westin Hotel In Seattle. Co-sponsors for the conference include The Bullitt Foundation, U S WEST, Microsoft, McCaw Cellular and Cellular One, GTE, the Washingotn State Department of Transportation, the Washington State Energy Office, and the Puget Sound Air Pollution Control Agency.

Additional co-sposnors are being sought, as well as exhibitors. (Exhibit space has been secured for the day of and day before -- the Economic Development Council of Seattle and King County is hosting its annual economic forecast luncheon the day before in the same space).

The purpose of the telecommunications conference is to identify the potential impacts of emerging technologies.

Public policy makers and elected officials cannot be expected to develop policies that will maximize public benefits from the emerging technologies if they remain unfamiliar with the broad range of applications available. Similarly, the private sector, which is gearing up for massive investment in applying these technolgies, cannot be expected to focus on maximizing public purpose in a free market economy.

The conference will bring these two groups together to ensure that residents, businesses and institutions in this region derive the greatest benefits from the technology while concurrently protecting and improving the region's high quality of life and environment.

The kind of questions that will be explored at the conference include:

What are the opportunities in reducing traffic, improving air quality, and enhancing quality of life that can come with the emerging "Information Superhighway"?

What are the obstacles to rapid deployment of te new technology?

How might telecommunications affect urban and rural development?

For general information about the conference, contact Richard Milne at the Puget Sound Regional Council, milnera@psrc.wa.com, (206) 587-5060.
For registration information, contact Carol Thompson at the Regional Council, (206) 464-7528.
For information about exhibit space, contact Lee Williams, Bright & Associates, (703) 823-6522

>IMHO any attempt to get speed more than 9600 on HandHeld or other 'voice'
>Radio is problem. Even if we find new modulation. With half-duplex

Can I ask a question here? How is it possible to get the necessary S/N ratio
and other such to get a V.32bis modem to operate correctly over a Cell Phone?

It seems to me that it IS possible for cell phones to provide a clean enough
signal to do data over them, so why do hams have so much trouble getting
the needed S/N ratio to run at 9600? I must really be dense and missing
something. I understand that the example of V.32bis (14.4kbps) over cellphone
is point-to-point. So are most amateur 56K links. Why can't we do a high
speed link over inexpensive gear and limited bandwidth? It seems to work
for cell...

Thanx for the response. Can you give me any specific recommendations for one
of the common modem configurations ? As an amateur effort, we are resource
limited, of course...

I should have made it clear that we don't know anything about radio, either,
so do you have any recommendations there ???

We are using a purpose-built protocol, and have both ends well under way,
but we don't know how to hook them together yet......

I got mine directly from TEKK:
1-800-521-8355

For the T-Net Micro (KS-900) it's $119.00 + $25.00 for a custom frequency
change... Make sure you mention you're an amateur radio op, this price
is the reduced amateur price...

Good luck!

Hello Friend Hams.....

I have just purchased a HAL CRI-200 Computer RTTY Interface and am
looking to find some information on same.

1. Does anyone have a manual that I could get a xerox of?

2. What is the power voltage and polarity required at the dc power
adapter socket on the back panel (+12vdc? GND=SHELL?).

3. What is the pinout and interface specifications on the 5 pin
computer I/O port connector? I am assuming RS-232, but it could
be something funky like 5V tty RS-232, or it might even be current
loop (20 ma).

4. What are the cw keying polarities on the two keying jacks?
Any Help is appreciated

Most Sincerely,
Robert D. Keys, ``Boatanchor Bob'', NA4G

From: mfoster@trc.amoco.com
Message-ID: <CxB82G.ICr@trc.amoco.com>
Source record: 47100

At this time the root cause of the problem has not been identified in our area.
Others on the net have claimed X1JR2, 10mhz speedup and dcd mod has solved their problems.
I believe those changes only mask the real problem.

The problem appears to be site specific. It appears dependent on the type of traffic
the node sees, especially large packet sizes. We have noted that band openings
with lots of collisions of weak signals will drop the buffers very quickly.

We have moved equipment from a problem site to a non-problem site (simple swap) and
observed that the problem does not move. The problem site remained a problem.
Many of the X1J nodes around our area work fine, so we understand the frustration
some of the node operators have been experiencing.

I am sure if there is a solution to the problem, a post to the net will be made.

3507. Problem with MFJ-1278 and TH-77A

Newsgroup: rec.radio.amateur.digital.misc

From: deiterim@carleton.edu
Message-ID: <1994Oct7.133805.1@carleton.edu>
Source record: 47096

Hi everyone,

This is my first time posting anything on usenet, so I hope this makes it through alright. I have a bit of a problem connecting my Knwd TH-77A and my tnc, MFJ-1278. When I try to connect to other stations, sometimes my station connects and sometimes it doesn't. Originally thinking there was a wiring problem, I went back and checked it. Everything checked out fine. Then I decided to monitor the signal and noticed and interesting effect: Depending on the position of the wire connecting the tnc to the handheld, I either get a good amount of modulation or I get very low modulation (I can hear the signal in the background of a lot of noise). Thinking that I had either a connector problem or a line problem I went and reworked the wiring, again. This time I used some expensive shielded cable and gold plated connectors. However, this appeared to have no effect. So I decided to put some RF chokes on the line, just to make sure I was not getting any random noise, but this also made no difference. So I began to question whether or not the connectors in the handheld were good, so I took it apart and checked them, turned out to be fine. What should I try from here?

Other things I noticed: When I just took a handheld and held it close to the tnc, there was a lot of noise eminating from it (more than my computer I use to run the tnc software). I did try shielding the tnc also, but that did not seem to have an effect on the problem.

I would really appreciate any thoughts about this problem. I have been struggling with it for over a year now and am getting really tired of the problem.

Tnx in advance, Mark (N2PGD).

But what specific components do you need and where do you get them? I've
got a catalog from Down East Microwave, and I don't know what transverter
to put with the GRAPES modem. I need enough power output to reliably get
the signal to go 8 miles.

I had the same problem with a friend's TH77A and my TH226AT. I contacted MFJ
and they recommended pulling a resistor on the voltage divider circuit for the
transmit audio from the tnc. This greatly improved the transmit audio on the
'1278 and has been working for over a year.

>for cell...

You *are* missing something Dan. It's not SNR that's the problem. While
it's true that most ham HTs are sorely lacking in adequate SNR over many
paths for *any* type of modulation, including voice, hence the term handi-
scratchie, that's *not* the main problem. Cellular phones are like the
rest of the telephone system in that the phone network handles the addressing
and routing *out of band*. This means that when the phone rings, the modem
knows the signal is for it, and can initiate a *training* sequence with
the modem on the other end to equalize and utilize the one transmission
path then in use. It is an *exclusive* circuit with no other modem signals
present.

The only difference that a cellular modem faces versus wireline modems
is occasional signal dropouts due to handoffs, and the usual multipath
concerns. Therefore special modem parameters have to be used such as slow
disconnect so that the modem won't drop the connection during a brief handoff
outage, and robust error detection to handle the multipath induced symbol
errors. We already have all that in packet.

What we *don't* have on packet is out of band routing and addressing,
and what we *don't* have on packet is *exclusive* use of a frequency
for a pair of stations. A packet modem has to successfully decode the
header of *every* packet on the channel to assure that the packet either
is or is not addressed to it. It *cannot* initiate a training sequence

every time it hears a packet it can't decode. *That's* why packet modems can't use training, and training is the key to high speed data over a voice grade circuit. Every telco modem over 2400 baud uses some form of training at call setup. In packet, setup must be on a packet by packet basis, and that won't work because not all packets on the channel are addressed to the same modem.

With the typical Kenmore, Yahoo, Icky, and Motrash radios used by amateurs, no two of them will have the same bandpass characteristics. Training is *essential* to compensate for that, and for off channel stations. Amateur equipment doesn't have the frequency stability of commercial equipment, so it isn't unusual to have one or more radios a kilohertz or more off channel. Nor is it unusual to see wide differences in deviation from one radio to the next, even among those of the same make and model. Any modulation used has to be tolerant of all those errors *without* compensation on a packet by packet basis. That's why systems as slow as 9600 baud are difficult to setup with more than two stations. 2400 baud is about as fast as an uncompensated system can work with multiple players.

The limitation is *not* with the modems, it's with the *radios*. To successfully use high speed packet, we *must* have radios with identical response characteristics, and that means dedicated data radios, all optimized for the *same* response. Now it may be possible to compensate *all* radios the same way in a system by use of DSP, but it's not likely. There are two many variables outside the control of the DSP, such as whether the radio is on channel center or not, and the differing multipath from one radio path to the next. We need identical radios, *and* a modulation that is tolerant of certain types of errors. Such systems exist, I keep pointing to the GRAPES 56kb RF modem as an example, but insistance on using voice grade amateur equipment for high speed packet is futile. Amateur packet networks are *not* like the telco network, and telco techniques won't work.

Their no tune 432 transverter may be sufficient by itself for such
a path, assuming LOS and directional antennas. Or you can add the
amplifier they offer. They offer the whole package assembled and
tested, or as separate kits. We typically operate 3-7 watt systems
over 50-100 mile paths. Those paths are mountaintop to mountaintop,
but using omni vertical antennas on at least one end of the path.
For non-LOS use, more power, or a gain antenna, may be required.
We have one user who's running 100mW and a 1/4-wave vertical, but
he can see the switch on the mountain about 10 miles away.

You need about 2 microvolts into the modem to get a low BER, less
than one error in a million bits. So you can do any necessary path
calculations based on that.

QAM is fine, but not over typical voice grade amateur radios. The
GRAPES RF modem uses MSK, but it would generate QAM by a relatively
simple EPROM change. The detector would have to be redesigned however.
That's certainly doable, and may be an upgrade path for the modem. What
the RF modem offers that voice grade radios don't offer, however, is a
consistent RF section with known phase, frequency, and amplitude responses.
You'll never get that from a random collection of amateur voice grade radios,
and DSP can't compensate for *all* of them on the same channel at the same
time. There's no way to *train* to multiple signals from multiple *different*
kinds of radios coming along multiple paths in a random packet by packet
sequence.

> delivered to the user.

We have 128 kb *now* with modified GRAPES RF modems, and 256 kb is within conception without major modifications. Switching to multi-level QAM could double or triple even that, though paths would require higher SNR to give acceptable BER. Of course these are all *raw* rates, use of compression will allow even higher effective throughputs with any of these systems. To go above 1 Mbit/s raw will require rather fundamental redesign of equipment. But crude FSK equipment with that throughput is now available in the microwave range.

>: Another thing we need to realize is that $600 is just plain silly, and far
>: out ot reach of the end user. It's got to be $150 and use you hand held.

This is the fundamental fallacy of amateur packet. Anyone seriously doing packet will dedicate a radio to that use. Take the typical FT-530 at around $500 and the typical 9600 TNC such as the Kantronics 9612 at $220, and you've *already* spent more than needed for a 56 kb system, and your system is much less capable and reliable than the 56 kb unit.

>: All very do-able, but there are lots of issues to consider for the hardware.

It's *not* doable at amateur volumes. The market is too small to allow hitting a $150 price point with a DSP modem. And even if you could retail it for $300, you still have all the limitations of varying models of voice radios I've outlined in other messages.

> Perhaps the most important aspect of developing new modems is to have
> the stuff available off the shelf. In these days of surface mounted
> components, it is simply impractical to have people stuff a board
> with fine pitch 208 pin PQFP's using their Radio Shack 40 watt iron....

That's right, they have to spend $50 for a static hot air torch like the Weller Pyropen. Works fine for SMD assembly. SMD is definitely the wave of the future for all homebrew construction. Amateurs are going to have to get used to it. (The existing GRAPES modem doesn't use SMD however, though future versions might.)

Gary

>Any ideas ???

Packet may not be best for pure telemetry. It will give you an error free data stream by error detection and retries, but you'd have to run at least 9600 baud packet to get 1200 bps raw throughput, and really need a transceiver on each end. If instead you can tolerate the occasional transmission error, or use FEC, then what you want is a simple half-duplex modem over radio. The most ancient of these, the Bell 202 Standard type, will give you a raw 1200 bps throughput. A PSK modem would be more robust, however. The ones used to decode amateur satellite telemetry would do.

Telco modems generally can't be used because of their internal "smarts" which insist on attempting to setup a duplex link, and dropping it if carrier is momentarily lost. Only the ancient dumb modems meant for leased lines can generally be used.

>Suggestions and reference to recipes appreciated. TIA. Ken

There are a couple of commercial solutions, Kantronics has one, and TAPR has a data gathering unit that will work with any TNC. These are both dependent on packet radio and report in near real time their readings. If you have the channels you can dedicate to the task, you can use simpler telemetry, a voltage to frequency converter can be used to transmit an analog reading continously. What might be best, however, is a single board computer that can store readings and report them in a batch when you interrogate it via packet radio. That way you can have a bunch of sensor stations all sharing a single frequency.

3519. WNOS for Windows?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-08 16:54:33 UTC
From: stroup@gauss.usafa.af.mil
Message-ID: <stroup.4.0010E945@gauss.usafa.af.mil>
Source record: 47106

To all:
I currently use WNOS on a couple of the machine that I have here. I like it. I have it networked to a total of four machine and am trying to set it up for two hams to use the same WNOS station. My question is, does anyone know of plan for a Windows version of WNOS? I have two machines (not connected to TNCs/radios) that use Windows for Workgroups with the Wolverine TCP/IP drivers. I would like to be able to use these directly with WNOS. Also, does anyone know of a WNOS "FAQ"?

Thanks in advance!!!!

Actually, I have a good bit of this complete. It's in V/B, but it was written
around an MFJ 1278. If I ever get time to finish it and make it a little more
general, I will make it available somehow. Finding the time is a real problem
though :((I'm typing this from the plant on a gorgeous Saturday afternoon,
while waiting for a VMS upgrade to complete)

It's kind of neat though, It does the basic connect / disconnect stuff now, with
buttons. Even has a drop-down for connect that can do an MH to the TNC!
It uses a package called Modemware to manage the comm port I/O. It would
be tough without that.

I'd like to do a logging program too.

Message-ID: <9OCT199419063309@venus.tamu.edu>
Source record: 47121

Hi folks. We are working on a senior project involving wireless ethernet type transmissions and are experiencing difficulties. Our main concern is with CSMA/CD, and whether collision detection will work for wireless. We are under the impression that it will not, and need to know how this will affect ethernet operation. If anyone has any information on this subject, we would certainly appreciate the help.

Thanks in advance,
Andreas Iacovides - 5B4SJ/W5

>path then in use. It is an *exclusive* circuit with no other modem signals
>present.

Most of the high speed packet usage I've seen has been for dedicated point-
to-point links. At least that's the case up here in the northeast. When
that IS the case, the issue of multiple signals goes away (or let's assume
so for the sake of discussion).

Assume two radios of known manufacture (and same brand and model just to
ensure all is the same). Assume FULL DUPLEX on two frequencies, so that
both ends are ALWAYS keyed and transmitting. This eliminates the call setup
issues.

Now, I still do not understand how a cell phone can get 14.4kBPS through
a channel where we could not do the same on a dedicated, full duplex
circuit.

I understand fully the switching mechanisms, dedicated point-to-point nature
of telephones, and the like. What I really want to hear more about is the
actual data over a voice grade telephone circuit part of things.

So if we were to construct equipment for dedicated links as I described
above, and used training, then we'd be able to get 14.4K or 28.8k data
rates over a 3kHz wide voice passband? (again assuming the dedicated
pair of frequencies, and RF gear of known design).

I guess I'd always assumed that the GRAPES stuff was used to build backbone links of a network. From the issues you raise, it appears that this is a misconception, and that you have set up networks of multi-access stations over GRAPES modems at 56K. Is this correct?

Collision Detection as done on Ethernet depends on the known maximum propagation
time of the packets on the wire, and the known minimum packet size, which is
specified to ensure two stations which transmit at the same time will indeed
notice each other transmitting.

Collision Detection also assumes you can monitor the medium while transmitting.
Ethernet transceivers do this, looking for indication of collision, and
sending a collision signal back to the ethernet controller if necessary.

Radio setups tend not to do well having a transmitter and a receiver on the
same frequency on the same antenna or close antennas. Your receiver will
be swamped (overloaded) by the transmitter. As a result, it would be
difficult to detect collisions in the same manner as Ethernet.

Look into Collision Avoidance schemes in some of your texts.

Hi

Is there someone who read this net that works Jnos with a Baycom
modem ?

I have a few questions about that set-up

1 What I do with the ASY port command in the autoexec.nos ?
Should I put them under a disable with a # and just keep
the attach packet command ?

2 How about all the commands with the AX0 statement ?

3 If you works a baycom under Jnos could you email me your
autoexec.nos ? The author of the driver seem to have done a
good job for the driver but the .doc is a little to thin
about a permanent set-up in the autoexec.nos

By the way the latest driver and doc that I have is
from january 1993 is there something newer out there ?

> hard disk packed up on me (no fault of the software)
I run a MUD (Multi User Dungeon, cross between a text adventure game and the
conference bridges) On a Linux system. It's still undergoing building and
testing, but is available to radio amateurs (only)

I guess you could say I run a MUD with Baycom modems, the Linux machine is
slip-linked to another machine running NOS and ax.25.com that has a baycom
modem. I don't suggest playing muds over 1200bd radio channels, 4800 is ok
but 9600 is much better!

If you want details about it, mail me.

>a channel where we could not do the same on a dedicated, full duplex
>circuit.

We can, of course. In fact, with the system you propose, we can simply
use telephone modems and slip or PPP. The down side is that we have
basically two repeaters, with their expensive duplexers, tying up two
channels all the time for sporadic data transmissions between two stations.
That's very wasteful.

>So if we were to construct equipment for dedicated links as I described
>above, and used training, then we'd be able to get 14.4K or 28.8k data
>rates over a 3kHz wide voice passband? (again assuming the dedicated
>pair of frequencies, and RF gear of known design).

Probably. The telco line has less phase distortion than the typical
amateur grade voice radio's IF filter, so it might still be somewhat
less, but we can let the telco style modems negotiate and train to
work around that as best they can.

>I guess I'd always assumed that the GRAPES stuff was used to build backbone
>links of a network. From the issues you raise, it appears that this is
>a misconception, and that you have set up networks of multi-access
>stations over GRAPES modems at 56K. Is this correct?

It slices, it dices, *and* it makes mounds of coleslaw. :-)

Yes, The GRAPES modems are suitable for use in user MANs. In fact that
was the original purpose of the design. They also happen to be useful
for medium speed trunks, but that's just a bonus. The modem hasn't been
as widely adopted by users as we'd like, but it certainly is designed
to be an end user system. As I keep pointing out, it's cheaper than a

dedicated voice radio and low speed modem. Ok, it's a kit in an era of appliance operators, and until recently you've had to scrounge for transverters, but these things are simpler than most kits, certainly easier to build and get running properly than the Ramsey transceivers. The only real drawback is that they don't interoperate with low speed modems. You must have someone else in the area with one if you want to use it, but that's true of most 9600 baud modems too.

: > components, it is simply impractical to have people stuff a board
: > with fine pitch 208 pin PQFP's using their Radio Shack 40 watt iron....

: That's right, they have to spend $50 for a static hot air torch like
: the Weller Pyropen. Works fine for SMD assembly. SMD is definitely the
: wave of the future for all homebrew construction. Amateurs are going
: to have to get used to it. (The existing GRAPES modem doesn't use SMD
: however, though future versions might.)

I have seen your postings before about the Pyropen and put it on the list to evaluate.. One of the other hats I wear is that of a hardware vendor - we design/manufacture peripherals for one of the other personal computer architectures. We run several hundred SMT boards at a time through contract assembly houses. I can tell you from firsthand experience that even a professional assembler has a certain fallout rate with 25 mil packages. Would like to believe the average ham can pick up a pyropen, lay down some solder paste, and hit a home run soldering something like a pqfp160 package, but this really stretches the imagination a bit ;-) It's not so much having the tools, it is the technique in using them...

3536. More on Using 49MHz for Data

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-10 14:52:06 UTC
From: mack@mails.imed.COM
Message-ID: <9409107818.AA781805081@mails.imed.com>
Source record: 47046

Stupid me, I posted this to the wrong group!

_____ Forward Header _____
Subject: More on Using 49MHz for Data
Author: Mack Ray at nfsoffice
Date: 10/10/94 8:49 AM

Gentlemen:

Now that we have the specs out in the group (thanks much) it is
easier to design a solution for the requestor.

It appears to me that Part 15 ONLY applies to the transmitter part
of the setup. Therefor, it is possible to greatly increase the range
by using a directional gain antenna.

My proposed solution is this:

1) build the transmitter to take advantage of the 100mW limit.
2) build a short loaded horizontally polarized dipole.
3) build (or buy) a 4 to 5 element Yagi. This should give about
10 db of gain and has the additional benefit of rejecting most
of the signals from other users of the band. It is possible to
buy a 6M beam and just tune it down to 49 MHz.

Remenber that Part 15 devices must ACCEPT all interference they may
encounter.

3537. Still More on low Speed data link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-10 15:05:04 UTC
From: mack@mails.imed.COM
Message-ID: <9409107818.AA781805979@mails.imed.com>
Source record: 47129

I have one more thought ont using 49MHz. Hustler makes a 2M 5/8 mobile antenna that is under 1 meter in length. It turns out that it tunes up very well at 50MHz because the loading coil makes it look like 3/4 wavelength at 144MHz and 1/4 wavelength at 50MHz. This would be an excellent solution for a vertically polarized antenna. The down side of this is that you are likely to receive more interference from other users of the band. You should get about 20db of isolation between vertically polarized users and horizontally polarized users of the band.

No argument there, technique is everything. I *can* use a Bernz-O-Matic
torch for SMD, though I prefer not to. It's all in the technique. What
won't work is inadequate heat flow. That's why the pointy little irons
are worse than useless. The ideal system keeps the temperature below
398 C while maximizing heat flow. You can simulate that with the torches
by suitable variation of distance and time, but a real controlled hot
semi-inert gas source works best. The Pyropen will give you a oxygen
depleted hot air flow that does nice work if you control distance and
time well enough. All that takes is practice. (Sounds like a pitch for
Morse Code.) :-)

..N1JEB sez:

Collision Detection as done on Ethernet depends on the known maximum propagation
time of the packets on the wire, and the known minimum packet size, which is
specified to ensure two stations which transmit at the same time will indeed
notice each other transmitting.

Collision Detection also assumes you can monitor the medium while transmitting.
Ethernet transceivers do this, looking for indication of collision, and
sending a collision signal back to the ethernet controller if necessary.

To which, I reply:

Not quite. It's true that CD requires that you be able to monitor the medium,
but in the case of the original Ethernet (as defined in the joint Digital-
Intel-Xerox "Blue Book" about 12 years ago), it was defined as a specific
negative voltage on the center conductor of the coax referred to the shield.
Every transceiver was supposed to be able sink a certain amount of current,
and if two of them tried to, it generated a higher (more negative voltage),
which in turn tripped a comparator in the transceiver which kicked on the
CD oscillator and told the controller to start backing off. When we designed
it this way, it was a lot easier to do at the time rather than trying to do
bit-by-bit data comparisons of one's own transmitted signal to see if there
was QRM on the wire. (Remember, the original implementations were in MSI
"jelly bean" logic, and only when things settled out, were we able to start
cranking out LSI/VLSI versions of the transceivers and the controllers!). I
was on the transceiver design team at the time, and we initially wrestled
with ac coupling versus dc coupling as well as other approaches. In fact,
the concept of sending a CD burst after the end of each packet was done to
ensure that controller knew that the transceiver was working properly and
that no real collision had occurred during transmission. (Imagine what it

would have been like if the transceiver were deaf to network activity!)

For radio purposes, it's a bit more difficult to pull off, as demonstrated by the Aloha Net set up in Hawaii back in the 70's on the VHF High Band. That was a Carrier Sense Multiple Access network, but with no explicit collision detect.

Having the same problem. The only other solution I've heard of is to use 10Mhz TNC's. Over the last weekend, I spoke to Bert, VE2BLY, who suggested that the R2 firmware is just buggy, and that the only solution is to switch back to R1 until they fix it. Apparently, all you lose is the 3 extra channels for D/A conversion, but if you're not using them, it's no big loss.

If you learn of any other solutions, PLEASE post it here or email. Thanks.

jnos1.10g contains the serial ports mods we created for the switch at
WB2PSI. That system has been running 4-6 async ports for a few years.
The COM1/2 limit conception may come from documentation problems but not
from the code itself!

the PSI mods also added the chained IRQ code from GRI along with matrix
capable NetROM flow control.

Thanks for all the clarifications. It all makes more sense now.

As for the acceptance of the GRAPES system, I've a few suggestions and questions. The requirement for an outboard transverter from a different source is definitely a problem. If your group had a transverter setup as part of the kit (or available as part of it) you'd certainly get more people to go for it. It's a lot simpler to buy a kit of boards and perhaps components from a single source, rather than multiple ones.

What does the modem communicate with? Does it take in an HDLC data stream? I do software for routers that talk IP and the like, and have thought about writing a driver to do the IP over AX.25 stuff used on packet radio IP. (If someone'd point me toward documentation of the details of the packet formats, and if I can get the router to slow down enough, I might be able to write such a beast). I can connect off of my boxes at V.35, RS-232 or X.21 line levels. I suspect I'd have to adapt those for your modem, but perhaps not. Could be interesting to have a router on my house ethernet talking IP to the radio world...

Having the modem work with transverters was a design decision to allow
as much flexibility in band choice as possible. I'm not on the GRAPES
board anymore, but when I was, we discussed the issue of offering a
transverter with the kits. The consensus was that GRAPES wasn't a
commercial concern, and couldn't afford to get into the business of
stocking third party equipment. That would be sort of like asking
TAPR to stock Kenwood radios to go with their TNC kits.

>What does the modem communicate with? Does it take in an HDLC data stream?

>the radio world...

The modem behaves as an ordinary synchronous modem. It accepts TTL data
as input and supplies Tx clock, Rx clock, and received data. It was
designed to be compatible with the TNC2 modem disconnect header, but
will work with other digital hardware such as the Ottawa PI card or the
Gracillis card (both designed with driving the GRAPES modem in mind),
or any other system that expects to interface with a synchronous modem
and is capable of doing the required data rates. The protocols used are
up to the digital hardware and it's drivers.

3547. Re: Ham-Digital Digest V94 #336

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-11 01:45:23 UTC
From: mwestfal@iris.CSci.CSusb.EDU
Message-ID: <9410110145.AA03063@iris.csci.csusb.edu>
Source record: 47136

In a former treatise, Ham-Digital Mailing List and Newsgroup spake thusly:

-> Date: 10 Oct 94 22:03:19 GMT
-> From: jca@pe1dgz.TNO.NL (Jan-Charles Aarden)
-> Subject: JNOS 1.10G & 4 asy ports??
->
-> Hi,
->
-> I compiled JNOS 1.10G for a friend. His object is to run JNOS with
-> 4 PK-88's on different ports. The ports DO HAVE unique addresses and
-> IRQ's but JNOS can only use COM1 and COM2.
-> Is there a solution for this problem?
-> (I do agree that he can better use a SCC card but that is not the issue,hi)

Since when does JNOS support only COM1 & COM2? I'm using JNOS 1.10G and
I have 4 asy ports attached, and they all work fine...

You just gotta make sure each asy port has it's own IRQ. The "normal"
COM3 & COM4 won't work if your using COM1 & COM2 (the normal ones, that is..)
You have to rewire the IRQs for COM3 & COM4 to use IRQs other than IRQ3
and IRQ4....

73 to all OM,

I've found an extension for Graphic Packet called GP-BOX that allow GP
users to have a PMS an more with Graphic Packet v1.61 terminal programm.

But this extension is in German language, language that I don't understand.
So if someone have a French or English version and can post it to me or
tell me where I can found it, this could be fun !!

TNX to all in advance.

: that the R2 firmware is just buggy, and that the only solution is to switch
: back to R1 until they fix it. Apparently, all you lose is the 3 extra
: channels for D/A conversion, but if you're not using them, it's no big loss.

I don't know if switching back to X1J R1 will solve your buffer problem
because I saw the "node busy" / low buffer problem with X1JR1.

This problem seems to surface at sites that hear many partial packets. Is
that consistant with everyone's thoughts? Maybe we can list the associated
symptoms and help the developers locate the weakness. I'm sure they
would appreciate our help. I agree that DCD mods, closed squelch, and
faster clock rates may be band-aids but discussing these fixes may
help someone locate the problem.

Prior to installing X1J (I was using TN2.11), I had a 4.9 Mhz TNC with
no DCD mod and I ran open squelch. That all changed with X1J.

Source record: 47045

I just read my last 2 posts in the digest. Could anyone understand what I said? It wasn't clear (to me when I read it again) that my primary suggestion is to use a 100mW transmitter with a center loaded dipole for transmit (total antenna length 1 meter). At the receive end use a 4 or 5 element 6 meter beam (modified for 49MHz) to get both gain and directivity. This kind of arrangement ought to be good for 4 to 5 miles.

3555. The Second UKIP Network Group Meeting - FINAL INFO

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-11 22:03:24 UTC
From: eeyimkn@unicorn.nott.ac.uk
Message-ID: <37f23c$pp9@unicorn.ccc.nottingham.ac.uk>
Source record: 47068
Cross-posted to: uk.radio.amateur,rec.radio.amateur.digital.misc

Hi folks,

THE SECOND NATIONAL UKIP NETWORK GROUP MEETING - FINAL DETAILS

Sorry for the delay with getting this sorted out, but I have been rather busy recently with a lot of stuff, such as signing on, applying for jobs, sitting around mooching, and all the other activities generally associated with those who've just stopped being students.

Anyway, here are the final details:

The meeting will be held THIS SATURDAY (15th October), as agreed in June, and will once again be at the Department Of Computer Science of the University of Nottingham.
The meeting is due to start at 10:30AM, with arrival and refreshments (yes, I am actually sorting them out this time!) from 10:00. The estimated finish time will be around 1600, with the opportunity once again to adjourn to one of the SU bars for more informal discussions..

There will be a nominal meeting fee of ukp1.50 per person, to cover meeting expenses, plastic cups, coffee, etc. This will include tea & coffee, though, so it's not all that bad. Sorry I've had to take this step this time, but the price of flourescent cardboard and magic markers is rising all the time..

AGENDA ITEMS! The agenda still looks rather bare. If you've got anything you want to discuss (which judging by some of the mailing list traffic most people have ;-)) then _please_ get them to me. I don't want to have to make up the agenda again *grin*

ASSISTANCE - Any assistance anyone can offer with talk-in, note-taking, and such would be appreciated. Thanks very much to those who've already offered.

DIRECTIONS

By train: Take the train to Nottingham, and take the No. 12 bus from opposite the station (direction Beeston?) to the university. Ask the driver to drop you at the South Entrance. The Tower Block is the big tall tower block (ahem) that's clearly visible.

By road:
FROM THE M1: Leave the M1 at Junction 25 (A52) and follow signs to Nottingham. Continue along the A52 until you reach the large roundabout (with signs right to the East Midlands Conference Centre). Turn right

here, then left at the next roundabout into the West Entrance of the University. Take the first right then immediately left onto Cut-Through Lane. Continue on this road until you see signs for _either_ the Department of Computer Science or Electronic Engineering, then follow around the roads and park around Science City. The meeting is in the large tower block - the room will be signed.

FROM THE A1: This is actually simpler than the M1 (IMHO). Leave the A1 at Grantham and take the A52 in the direction of Nottingham. The A52 eventually (I think) becomes the Nottingham ring road - just stay on it until you reach the exit (after passing the multiplex cinema & retail park on your left) for Dunkirk, which should be also signed for the University. Come off the ringroad here, go straight across the roundabout at the bottom and drive up the side of the University. Take the first left turn into the University, before the Tower Block. (this is "Science Road"). This brings you straight into the right bit of campus. Find somewhere to park around Science City, there's plenty of space. Then make your way to the tower block.

If in doubt (and Nottingham can be a confusing place) call talk-in, either on 144.550 or 433.550 (S22/SU22).

Any queries should be directed to me, either electronically to eeyimkn@unicorn.nott.ac.uk, or give me a ring on (01926)424705. If you're not yet a member of the UKIP mailing list on the Internet, send mail to ukip-request@cs.nott.ac.uk to join.

That looks like being about it - look forward to seeing you there!

Cheers
Mike

This is exactly as we have determined...We have severe HTS on a couple
of 7,000 Ft Mtn top sites that serve 2 valleys, the valleys do not
hear each other, so the node is consistently hearing partial and
stepped on packets because of this...

->
-> Prior to installing X1J (I was using TN2.11), I had a 4.9 Mhz TNC wit

(If this group has a FAQ, this question is probably there. But I have not seen one)

How can I send e-mail to a friend of mine who is on the packet-radio network? I have his call sign as well as the call sign for the station from which he retrieves his messages.

Also he'd like to send mail from the packet to the internet; is this easily done in the U.S.? (I know packet-internet gateways in other countries - my father uses one).

Thanks

From: Giovanni Mazzola <MC3626@mclink.it>
Message-ID: <781951680.MC3626@mclink.it>
Source record: 47078

Yesterday I bought a brand-new TM-733E to use mainly for 9600 baud packet (JNOS) with a TNC-2H (from Symek - DK9SJ). I am greatly disappointed for the poor response of this radio, just because it has a "dedicated" port for a high-speed modem and this works bad. Watching the electric diagrams of the TM-733 I understand that this latter *can't* work well at 9600 baud...

Any experience by other users ? Any help ?

I am really upset. My FT-736R runs perfect at 9600 and most of the friends operating at 9600 baud using older rigs or simply modified radios have very good performances (at a fraction of cost, compared to the 733).

Don't buy this radio if you plan to use it for high-speed packet !!!

Giovanni Mazzola, IT9XXS.

3564. Re: THENET X1J2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-12 10:34:41 UTC
From: roberts@ses6a.bt.co.uk
Message-ID: <37ge41$b0t@pheidippides.axion.bt.co.uk>
Source record: 47081

I must apologise for the problems suffered.

I have never been sure where to look as I have never been able to
regenerate the buffer loss problem in the local nodes over here, so
was reduced to reading the code and scratching my head.

I have just found (like last night) a possible cause for the problem.
When the node is very busy, and needs to reject a connection, and if
rs232 crosslink protocol mode 2 is not being used, the node fails to
release the memory used by the received packet.

A quick fix for this (untried) is to patch one byte of the code.
If this appears to fix it, I'll recompile and fix a couple of other
things and rerelease it.

To do the patch (in thenet X1J release 2) debug the file THENET1.X1J
and look at the byte offset 0x13d8 into that file (if you are using
DEBUG under DOS don't forget that DEBUG will add 0x100 so do a D 14d8
and the byte at that address should be 0x2a. Change this to 0x24. This
will cause the code to call the memory deallocation routine.

Please, this is a quick and dirty fix that I have *not* tested. If it
does not work at all, I've messed up the fix. If the problem persists
there's another bug yet to be found. If it works, I'll redo it properly.
Be aware that it is theoretically possible (if not likely) for very
heavy traffic alone to take a node out if used inadvisably.

Once again, my apologies and let me know how you get on.

73's

Dave G8KBB

Do you mean hear partial packets from anywhere (HTS packets) or packets
directed at the node?

Howdy and thanx for taking the time from your busy day
to help me.

I am new to the KAM+ TNC, formerly a TINY-2 user. Anyway, here's
the problem. Someone told me that the KAM RELink command is similar
to the CONPerm command in the TINY-2. I turn this parameter ON and
if I disconnect due to too many RETries the KAM+ fails to reconnect.
I believe I'm doing something wrong or the KAM+ doesn't work the
way I want it to. Thanx for your help. 73 de Walt - K2WK

No need for apologies Dave...your work is very much appreciated. We have been managing this minor problem and everyone has been quite patient.

We will be patching as soon as possible. Our key problem site is remote and will probably not get changed until late this weekend.

Thanks for responding to this problem, I'm sure several folks will be following with a watchful eye.

3572. TheNet X-1J memory loss fix

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-12 13:53:56 UTC
From: roberts@ses6a.bt.co.uk
Message-ID: <37gppk$dfl@pheidippides.axion.bt.co.uk>
Source record: 47055

A number of messages have been posted referring to problems with buffer losses in heavy traffic.

I have never been sure where to look as I have never been able to regenerate the buffer loss problem in the local nodes over here, so was reduced to reading the code and scratching my head.

I have just found (like last night) a possible cause for the problem. When the node is very busy, and needs to reject a connection, and if rs232 crosslink protocol mode 2 is not being used, the node fails to release the memory used by the received packet.

A quick fix for this (untried) is to patch one byte of the code. If this appears to fix it, I'll recompile and fix a couple of other things and rerelease it.

To do the patch (in thenet X1J release 2) debug the file THENET1.X1J and look at the byte offset 0x13d8 into that file (if you are using DEBUG under DOS don't forget that DEBUG will add 0x100 so do a D 14d8 and the byte at that address should be 0x2a. Change this to 0x24. This will cause the code to call the memory deallocation routine.

Please, this is a quick and dirty fix that I have *not* tested. If it does not work at all, I've messed up the fix. If the problem persists there's another bug yet to be found. If it works, I'll redo it properly. Be aware that it is theoretically possible (if not likely) for very heavy traffic alone to take a node out if used inadvisably.

Once again, my apologies and let me know how you get on.

I might also add that the Hustler fold-over HF mobile mast for use with coils for various HF bands also is 1/4 wavelength on 6 meters as well as 3/4 wavelength on 2 meters. I have been able to use the antenna on both bands with some success.

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

3576. What am I hearing ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-12 17:53:15 UTC
From: pasek001@maroon.tc.umn.edu
Message-ID: <55636.pasek001@maroon.tc.umn.edu>
Source record: 47077

I was playing around with Hamcom 3.0 last night to see what it does, and after copying the usual CW & RTTY on 20 meters I decided to poke around the SWL/Military Freq's with my TS440s.

On numerous frequencies between 8 - 14 mhz I found strong signals running 850 hz shift. I tried to decode them as: RTTY,ASCII7,ASCII8,AMATOR in speeds ranging from 45 baud to 150 baud with Normal & Reverse Shifts.

I got nothing.. naddda.. zip.. just a screen full of garbage. Using the pulse timing mode it appears that the Mark pulse width is 10ms.

What am I hearing ?? I looked thru the various FAQ's and found nothing, but if I misssed it please refer to it and I'll look there.

Thanks for the help..

This may sound stupid, but did you enable the "9600 Baud" feature?
It's a key combination on the front panel. Without it, it won't work.

I'll e-mail you the documentation that's been posted on this newsgroup.

I don't think the RELink will do the same thing as the CONPerm of the
AEA products. I've used both and AEA PK-88 and Kantronics KPC-3s
and the PK-88 would reach out and re-connect when our packet cluster
disconnected me and the KPC-3s will not. I don't know any more
about it than that. Too bad the PK-88 doesn't have a node function
and use less power. I like the CONPerm feature.

I've been reading a few bulletins in the UK and apparently the Baycom
team have gone commercial and are not letting the program circulate
and then asking for donations from the people who like it and use it.

So getting hold of the manual and program could prove expensive (?)
and users of previous versions won't be getting a discount

The only place to get hold of it will probably be from the team direct
in Germany (sorry - I forget the address) as it's not likely to
surface on any of the popular FTP sites.

Please correct me if I am wrong!

From: Giovanni Mazzola <MC3626@mclink.it>
Message-ID: <782044396.MC3626@mclink.it>
Source record: 47079

Thanks for the many replies about the TM-733.

Somebody asked if I turned on the "9600 baud" feature. Yes, I did of course.

The two main problems with the '733 are related to the TX:

o) a very long switching time between TX/RX (so you must use TXDelay 30 or longer, both with AX-25 and JNOS)

o) it is impossible to find a dip-switch setting on the TNC to have a good shape of the 9600 baud pulses transmitted by the TM-733. The transmitted eye-pattern is really poor.

If you take a look at the diagrams of the '733 you can see that the signal to be trasmitted (entering the DATA socket) passes so many stages, the same path as the mic-signal does. Until now all the equipment I modified for 9600 baud, must have the TX-data signal connected directly to the PLL varicap or it won't work at all. Instead, on the 733 there's a specialised IC where the modulation/data enters the same pin. This will surely work for 1200, but *not* for 9600 !

I have no problems at all on the RX side, although I didn't check with the satellites but only on terrestrial TCP/IP (JNOS) and AX-25.

The rest of the radio works well.

I'll try to return the equipment back to the dealer...

Thanks for the attention.

73's, Giovanni IT9XXS.

To the unnamed pp000814 -
As a subscriber and nationwide roamer using cellular mobile service, I have found that every cellular or PCS provider has a different method of interfering when I dial 9-1-1 to report a serious problem on the highways. There is no reason that direct emergency calls to 9-1-1 should be hindered in this way. I found that the wireline cellular carriers in Michigan/Indiana publicize their *-1-1 service, but it just goes into a continuous ring cycle, and of course nobody answers their "O" lines either when you try to report the problem.

I believe so strongly in universal 911 access that I am planning to author a formal request for FCC rulemaking in the near future. So, to get directly to your inquiry, what is needed?
An FCC requirement that every radio-based voice communications service provider shall directly route any call to 9-1-1 to the local PSAP appropriate for the general area where the call was originated (The same algorithms used to provide automatic transmitter site selection based on signal strength can be used to provide the call routing data). Further, each carrier must provide caller ID information to each PSAP, which is already provided for landline callers. Third, a direct callback input shall be provided so that every PSAP nationwide has the ability to re-dial and re-establish communications to the radio unit without dialing multiple carriers, their various switch access codes, and finally the radio subscriber's assigned number. In short, radio-based comm carriers must have service identical to that provided today by landline telephone providers, and at no charge, so that radio-based subscriber units shall have equal access to 9-1-1 services.

Scott - Motorola has provided quite a large number of computer-aided dispatch systems, partnering with various software houses and mainframe suppliers to build very complex interfaces to the "head-end" dispatch center. You should understand that the data protocols used over the air for the roaming data terminals are not the same ones you use fearlessly for direct hardwire connections. I am aware of some the issues at FedEx, but I think you need to talk to professional folks in the radio and computer industries, not radio amateurs.

: Do you mean hear partial packets from anywhere (HTS packets) or packets
: directed at the node?

: Larry

My feeling is anything that would make the DCD LED flicker, thereby
interrupting the processor. It seems that the CPU is interrupted,
buffers are used, but code doesn't know how to clear the "junk"
out of the buffers so they get used up and not cleared. Just my
"gut" feeling.

Gary, please pardon me if I put words in your mouth. I've been tracking the thread for a while and I agree with both your goals and implementation plan.

Dan, I think you missed some of the most basic principles that Gary has been trying to make to the amateur community for several years now;

1) You MUST build high-speed networks out of units that perform consistently, predictably, and in a nearly identical fashion. If you don't, you spend more time in establishing and maintaining the circuit than in moving the data.

2) GRAPES is not a just modem, not just a radio, not just a digital (ONLY) modulation method. It IS an integration of all three items into a package with documented, useable (and rather impressive), and repeatable performance parameters.

3) Amateur radio packet networks are BY DEFINITION multipoint networks that must operate reliably while having non-exclusive use of the radio channels. Data links made through telephone networks, conversely, are not shared and are not multi-point.

For all you PkGold users, I just learned this week that
Interflex has discontinued their bbs upgrade policy. This
was very handy for me to get the latest point fixes,
especially with all the Pk900 issues that were resolved.

Now they want $15 for a floppy upgrade for the point
bug fix releases (plus tax if you are lucky enough to
live in CA). Call them and register your dislike of
the new policy. Maybe they'll change back.

The product is great, the people there are very receptive
to suggestions, and the service is exceptional. Unfortunately
they have taken a step backwards with the new policy.

Well, this is going to age me but here goes.............

I have TWO Heathkit H-89 (factory built by Heathkit). The H-89 is
a Z80 based computer integrated into a 25 line (addressable) terminal.
These computers would make ideal dedicated Packet hosts. I have
all kinds of software for this system as well as the Disk Operating
System. The H-89 comes with a 'built-in' floppy, no hard disk. This
system is about 1980 vintage. I WILL purge these from my home inventory!
It will happen soon! I don't want to dump these, but.............

If any interest, lets see if we can swing a deal.

> I remember TECO - it was sort of like AWK only even more cryptic, wasn't it?

What? You prefer typing more than one or two characters for
each of your editor commands? Try writing down the keystrokes that
you use in whatever (god-forsaken) editor you use and see if it's more
or less cryptic than TECO.

Ah, all these youngsters, thinking that TECO goes all the way
back to the PDP-11 (Hint: The TX-0 was a one of a kind machine which
contributed lots of inspiration to the PDP-1 (no, I didn't forget the
second "1"), and it had TECO (in an early form)), and who think that
multics was an early (or even good for its time) operating system.
These whipper-snappers have no sense of history.

Actually, I must confess that I mostly use GNU-EMACS these
days. (In fact, it's my mail utility, my news reader, my man page
reader, etc.) But when ever I have to do a non-trivial editing macro,
I type control-Z at it, a "*" prompt appears in the mini-buffer, and I
type TECO. (I don't think that FSF is distributing it, but the TECO
package for GNU-EMACS is available.)

>I got nothing.. naddda.. zip.. just a screen full of garbage.

>What am I hearing ??

You are hearing encoded RTTY, ASCII, etc... I am no expert, but all those
things, including wire services, are now encoded... It used to be simple
coding, like flipping a bit here and there... But obviously that could be
easily figured out... So now, I am sure they are more highly encoded...
The good old days of printing the wire services is gone forever...

And pretty soon, all of the HF FAX stuff will be gone, too... The NAVY has
already announced the end of their FAX stuff... Satelite technology has
replaced all this HF stuff... Pretty soon just christian broadcasting...
The requirement for a general coverage receiver is getting less and less...

3601. Short comms links for packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-14 09:12:41 UTC
From: det@compd.com
Message-ID: <781714680snx@compd.com>
Source record: 47006

Can anyone help! I am running a packet BBS and I only have two ports which are used to connect to the two local nodes and they are both also used for users. The local novice users are only allowed to use 70cms which is the forwarding link and as the traffic is high they don't get much of a look in. I need to get the forwarding off the 70 cms to allow more user access. One of the nodes is in direct line of sight of my QTH and only 200 to 250 yards away.
Has anyone got any ideas of how I can link to this node (other than using one of the two radio ports) seems a shame to use a locally used freq just to link such a short distance. I can't link by direct land line as I am two blocks away from the node. So far I have thought of using IR and Lasar but these are affected by weather and as I am on a hill which get a lot of fog so I discounted them. Then I considered making 400MHz plus units but don't know how good they would be.
Has any one overcome this problem before any help would be much appreciated.

It's an expensive way to use a small amount of spectrum to convey very
little information over a very long time. What do hams do on packet?
Why the same thing they do with other forms of communications; they kick
lies and tell tires.

Actually it is a lot of fun and a natural extension of the radio hobby
for those of us also interested in computers. Packet is used much the
same way as wired computer-to-computer comms are used, i.e. BBSs,
E-mail, file transfer etc.

Joe,

I don't know as much as a tame crow, but I'm doing the same thing. So far, I've learned to get the jnos package (jnos110g.exe & optionally jnos110g.zip if you want the source code; it compiles under Borland C 3 I think) from ftp.ucsd.edu, and while you're there, be sure to get nosview304.zip which includes docs on the commands and some sample setup files. You should also get "NOSINTRO" from the ARRL or a local ham radio bookstore.

73,

W1HJF

Hey ted here's what i've sort of grep'ed from my little time with ham.

packet comes in many different flavors the more popular is AX.25
(based on the X.25 networking standard that much of the internet was
based on) thats about all that i know about that....then there's
tcp/ip which is known as a packet switched network.

ok this is probably not what you are lookin for but this may be

packet is a way of communicating digitally using the airwaves as your
mode of transit instead of a T1/56k leased/Ethernet-Lan/etc etc etc

it's kinda like using the internet over the airwaves.....

I have TWO Heathkit H-89 (factory built) computers. These are Z80 based machines built into a 'smart' 25 line addressable terminal. These are 1980 vintage, are compatible only with themselves! Both have built-in floppy drives, no hard-drives, run on a DOS system. If nothing else, the termials can be used to logon to other machines!

If you are into HAM radio, these would make an excellent choice for a dedicated PACKET host! XYL says these MUST GO! Make an offer!

This looks like a job for a wireless LAN product, or a good old
gunnplexer link. NCR Wavelan cards could easily span this distance
while giving high throughput. Since these work on 900 MHz using
spread spectrum, they're out of the way of your users. It does
require a PC at both ends of the link, but PCs make the best
packet switches, and are cheaper than most specialized hardware.
Or you can just set up a duplex gunnplexer link and run an ordinary
modem over them. Direct FSK of gunnplexers isn't a good idea because
of frequency drift. It's better to use tone modulation and AFC on
the carriers. Just treat it as permanent a wireline connection.

: "plug and play"...

Try Bob Morton of Maple Leaf Communications for transverters at
705-435-0689 or RR1, Everett, ON, Canada L0M 1J0. GRAPES has bought a
couple from him and ALANET has bought several. I believe he gets about
$279 each for his 8 watt units. I also understand he's working on a 35
watt model. The 8 watt units ought to get you 30-40 miles easily on
220MHz, maybe even 50 or 60 miles on a clear point to point link.

The only actual FAX I have seen on the KPC-3 was using Kantronics own program.

There are two other programs that >might< work, and since are both share-ware it won't cost you anything to try them first. WEFAXxx (have no idea of latest version) has been around and is popular...and JVFAX70 is extremely popular among the SWLs for receiving FAX. Most large BBSs that specialize in ham software have them (W3INK for example). I use paKet61 and Lan-Link 232 but neither support FAX yet although they do everything else but put out the cat.

The demo I saw with Kantronics software was most impressive.

3620. InterFlex Policy Changes

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-15 20:05:03 UTC
From: wb6uut@ix.netcom.com
Message-ID: <37pclf$bb2@ixnews1.ix.netcom.com>
Source record: 47026

In response to a recent posting by Bob Levine (levine@mc.com)

Bob:

We don't subscribe to the newsgroup, perhaps we should, but we
do support on our own BBS, and users can send messages to us
via Internet easily.

I was very surprised to have a user of KaGOLD send us a copy of
the public message you posted on Internet regarding our policy,
which you misquoted, and misrepresented. We do provide a high
level of customer service, a quality product, and take user
suggestions and put as many as we can into the software.

Version 9 updates:

Version 9 was introduced over 6 months ago, and since that time,
we have added a number of new features, not just bug fixes. We
send free disks to people who report bugs that we can duplicate,
and that are indeed bugs and not simply features that a user thinks
should work differently than we think they should.

We decided not to post minor changes to the program on our BBS
for a variety of reasons, and we apologize for the removal of
what several users viewed as an "entitlement" when in fact it
was simply a service we provided for free.

The $15 dollar update charge is for new features, not bug fixes,
and we decided to do it this way to keep the cost down. If we
are to continue adding features to the program, we have a few
choices as to how to handle them, and we elected the "minor update"
approach this time. Perhaps we were wrong, and should have waited
until a major and more pricey upgrade to include some of the new
features. It may turn out that users are unwilling to pay a small
amount for minor updates. I know I would gladly pay $15 to any of the
software companies I have purchased products from to get added features
and bug fixes, even if I hadn't run into any problems with their
software. And I have.

Our policy, and reason for it:

We would like to work for free, asking people for money is not
easy, not fun. Many hard working people like us enjoy what
we do, and wish we didn't have to charge for services. And perhaps
when we all get our universal medical coverage, free lunches, government
paid utility, food, and housing, we will then find working for free a
bit more realistic.

What we provided to you and others who purchase our software is a service that you use. Some of our users run our software everyday, for hours and hours. Compare it to the competitive products on a price value relationship, and I think our software is a bargain by comparison. But as we add features to the service, we think it is fair to ask for payment for added features. Some do not believe it is fair, and that we should update the software for free, and post these updates on our BBS.

One of your notes to us suggested that we switch our 14.4-K modems to 28.8-K modems. It would be nice if the modem suppliers would simply send us new modems, and we'd do it immediately. We don't expect them to do this, nor would we consider it fair. But back to our free updates: we posted free updates for several years, and it has been a very costly proposition. So we decided that if we were to add features to the software, on a more incremental basis, that we'd charge for those updates, also on a more incremental basis. We still post files to users on the BBS, as we posted to you on October 10, the day you requested it.

We will post files to users who are having problems, so that we can hear about the problems before we post the file, and find out if the problem is resolved after we post the file. Users who report bugs several months after running the program, after we have added new features, might believe they are entitled to both the bug fix and new features, but we do not believe that is fair. If a user reports a bug in a reasonable period of time (at present, 60 days is our nominal "reasonable period" of time) we send a free update, as we have for years. After that time, we will work on any problem being reported, and we make a judgment call as to whether that user should get a free disk, or buy an update that handles the reported problem (and get other features as well).

Using Internet to post complaints:

Your message is an example of the MIS-information highway, and the negative consequences that can result from users posting messages that are only 1/2 true, or misleading. Unfortunately, users are not held to a very high standard of accuracy in their postings. Also, it is human nature to believe negative stories about companies or people, rather than the positive ones. And unfortunately, misinformation propogates more quickly than information.

It would be interesting to know how many other companies are being unjustly critized on Internet, and on broadcasts in the packet networks, and elsewhere, and do not know it, and have no way of responding. When a radio company is critized on packet radio messages, do users understand that the company is barred from responding, either by FCC rules against regular business, or by the "packet police" that run the BBS systems around the country. We are an example in this case -- had we not had a friend who read your posting, we would not have known about it, nor had an opportunity to respond to it.

This is a very sad commentary on the "benefits" of this so-called "electronic highway" which may indeed be far less of a benefit than some

would have us believe.

Final comment:

So for those who read your first message, and made up their minds about our company, or whether to purchase our products based on that message, I can only say that the we are both losing something. We lose a sale and a customer, and you lose the chance to run a well-designed and feature packed program, with lots of customer support.

3621. GRAPES 56k RF modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-16 03:20:37 UTC
From: garrett@thunder.indstate.edu
Message-ID: <CxqxAE.8zB@onyx.indstate.edu>
Source record: 47023

In following the thread on 56k+ packet networking, I became very interested in this product, a GRAPES RF modem. If anyone knows where this product is listed or sold, I would very much like to find out where these gizmoes can be had. I am desinging a packet network to link area high schools to the Physics Department at Indiana State University and the higher the throughput the better, so if there's a faster possibility than a GRAPES RF modem, I'd certainly like to know about it.

P.S. I'm assuming GRAPES is an acronym. What does that thing stand for?

3622. Packet BBS posting from/to Japan?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-16 06:52:17 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseCxr735.8s8@netcom.com>
Source record: 47010

I have seen on my "home" packet BBS postings from many countries in Europe, some from South America, of course North America, but never seen any from Japan. A ham friend thinks that may be because of a 3rd party traffic rule or something forbidding automatic passing of posts from other hams or something.

What is the real story in Japan? They don't have packet BBS's like those in USA there? Or have the Japanese hams not linked their networks to the rest of the world?

> one dual mic cable set. Anyone successfully used one in digital modes?
> How is the cross-band repeater mode?

Just using your post to publish an interesting trick I just learned. The problem with using a mobile radio as a cross-band repeater is that when used with a regular repeater, you have to wait for the tail to drop - a nuisance to say the least. If, however, the repeater sends a PL tone keyed NOT to the PTT line as is usually done, but instead to the COR line, your radio will switch immediately.

Probably most of you guys knew this, but I didn't, thought it was slick, and wanted to spread it around! 73, W1HJF

3627. jnos40

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-16 22:05:06 UTC
From: pedr@gw6yms.demon.co.uk
Message-ID: <782345106snz@gw6yms.demon.co.uk>
Source record: 47011

Hi,
I wonder if any kind soul can help me. I recently "blew" some proms to enable my D/E to run jnos40 and I'm having lots of problems. Basically when connected in "consul mode" the D/E repeatedly goes into reboot and any params "added" are lost. Removing the D connectors on the radio ports and the problem is solved - not very helpful though. It would seem that I've configured the attach commands incorrectly for my unsquelched radios. (D4-10 and IC251E - rx audio in the latter case being obtained from the receiver detector stage) My attach commands are:
attach 1 slip home 1024 512 9600
attach 2 2m 256 1200 1
attach 3 430 256 9600 2
other combinations for the CD circuitry have also been tried to no avail.
Using the "slip" connection from my PC with a copy of jnos110g I thought would have given me a link to the outside world via the D/E - but although I can sometimes connect to the D/E and log on etc any attempt to connect further results in a link reset; it would seem that the D/E is rebooting.
Another problem - in the UK a CWID is required - is there a jnos40 version with this facility.
Sorry if the request is long winded.

3630. Pakratt for Windows vs PkGold

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-17 03:02:34 UTC
From: veith@cherokee.nsuok.edu
Message-ID: <Cxsr4B.r6@cherokee.nsuok.edu>
Source record: 47013

I'm interested in hearing comparisons of Pakratt for Windows
relative to PkGold.

Specifically I would like to know if Pakratt for Windows allows
the easy seperation of streams into seperate windows. This is
the feature I most value about PkGold; I can maintain a qso(s)
while keeping an eye on the rest of the network at the same
time. Does Pakratt for windows have this capability?

I'm a long time use of PkGold but interflex upgrade prices are
becoming too steep for me to justify.

Thanks es 73.

Can someone please provide the proper contact information for the Northeast Digital Association? I sent them a check for $15.00 which was supposed to pay for an associate membership and a copy of the 1994 annual NEDA publication which includes a great writeup on X1J.

Unfortunately I didn't make a note of where I sent the check, which they deposited on July 26, 1994. I have the canceled check here, so I know they have been paid. Now, I need to contact them to see what went wrong.

Thanks!

: Anyone having any Boston, MA specific info would be especially helpful.

I too am looking, but the info is very old, like digital-faq, August 1993.
I found the following in an April 1991 message from Tadd Torborg, KA2DEW:

There are clubs that may be of benefit to people who want to learn
more about packet radio. Here's some info.

North East Digital Association (I'm editor for this one)
Box 563 Manchester NH 03105 - NEDA runs a LARGE TheNET network of
35 multiport nodes over a 400mile range including
Boston, Concord, Manchester, Springfield, Pittsfield
Albany, Utica, Rochester, Binghamton, Buffalo. No
phone lines, no tricks, just 150 radios/TNCs with
dedicated point to point UHF, 220, 6m, 900, 1200mhz
links and 2m and 220 user access ports. The club publishes about 180
pages /year of newsletters, new user help stuff, tech stuff etc.
The Quarterly is about 35 pages/quarter.
Membership is $15/year for US. Send a SASE to the POBox.

Northern California Packet Association
This is an education and coordination club that puts out a quarterly
journal called the Downlink. The one I have here is 20 pages long and
is chock full of packet stuff. THey are
NCPA 6680 Alhambra Ave, Suite 111 Martinez CA 94553

Then there's a few magazines:

New England TCPer - This journal comes out 6 times a month and $12/year
NE TCPer 252 Stow Rd. Harvard, MA 01451

Digital Digest - TCP, AMTOR, RTTY, CW everything 6 times a year and
is 30 to 40 pages long including commercial advertising. $16/year
Digital Digest 4063 N. Goldenrod Rd Winter Park Florida 32792

Since this list is likely out of date, I've posted a separate message
asking for corrections and additions.

Would you share with me the documentation you managed to scrounge up?

Larry Wan

Sadly, your friend is right about the third party thing.

I am an engineer on merchant ships and do a lot of /MM in the Far East. I used to send mail home via packet and APlink through JA5TX but this spring the japanese feds must have cracked down on third party traffic because he had to stop accepting our traffic.

The japanese have a jillion (or more) PBBS stations, you can darn near see the ether near the coast (probably just smog though.) Few of them operate in English though and most of what you print out is gibberish (to them it becomes Kanjii characters.)

The Korean stations love to work packet and will jump in and ask for keyboard to keyboard QSO's when they see a foreign station. They are super to work. There is a packet backbone between Pusan, Korea and Fukuoka, Japan that handles a lot of traffic. That may be one way to route. doon't have the addresses handy but if you want I can look them up for you.

Actually - it's not "DOS" as in MS-DOS. It's either CP/M or HDOS,
which was Heathkit's own DOS.
This is posted only to save the original poster some grief and followup
mail. I'd take one but my wife would cause problems - there are already
7 computers in the house now...

Or better yet, instead of using UUENCODE, which uses characters that aren't going to survive some e-mail gateways, use the MIME standard that does. Why gosh-golly, if you use one of the standards, you might even find that you don't have to write code to use it, because your mailer might already understand it.

But then, being compatable and following standards would take all the fun out of it, eh? That's why we're AMATEURS, right?

3641. Re: Interflex Plocy Change

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-17 15:10:38 UTC
From: levine@mc.com
Message-ID: <37u45e$o89@jericho.mc.com>
Source record: 47025

Recently I posted this message to the net:

In article s73@jericho.mc.com, levine@mc.com (Bob Levine) writes:
-->For all you PkGold users, I just learned this week that
-->Interflex has discontinued their bbs upgrade policy. This
-->was very handy for me to get the latest point fixes,
-->especially with all the Pk900 issues that were resolved.
-->
-->Now they want $15 for a floppy upgrade for the point
-->bug fix releases (plus tax if you are lucky enough to
-->live in CA). Call them and register your dislike of
-->the new policy. Maybe they'll change back.
-->
-->The product is great, the people there are very receptive
-->to suggestions, and the service is exceptional. Unfortunately
-->they have taken a step backwards with the new policy.
-->
-->

I received an email from them correcting one point. Bug fixes
will be handled by a separate policy. I dont know what that
other policy will be yet.

From Interflex:

>We have stated repeatedly (to you, and to others) that BUG FIXES will be
>handled by a separate policy.
>
>What has changed is how we deliver MINOR UPGRADES -- and this was
>influenced greatly by those who felt that our minor upgrade policy
>discriminated against those without modems, those who felt it didn't
>work (because they couldn't figure out how to use the downloaded file)
>and those who felt that it was a REPLACEMENT for the TECHNICAL SUPPORT
>PROCESS.

Please excuse my incorrect posting about bug fixes. I tend to lump
bug fixes and enhancements to existing code in the same bucket.

Although I have some sympathy for those without modems, I stand
by my assertion that removing the BBS service for minor enhancements
is very dissapointing to me. I call several times per year from
Boston to California to keep my versions current.

I should also point out that most users including myself regard
Interflex's product as the Cadillac of the digital mode programs.

I personally own 3 registered versions (each registered to 2 different callsigns so my wife KA1WRW and I can each use them legally). I currently use regularly 2 different registered versions, one on a PK88 and 1 on a PK900. The PK88 is a dedicated Packetcluster station and the PK900 is for packet BBS and RTTY mainly.

Again, I love the product and highly reccomend it. It is well worth the money. My ONLY point in the posting was my dissapointment in the removal of the BBS upgrade service which was replaced by a $15 floppy mail method.

>to the rest of the world?

Hi,
I thought that I'd answer this question, at least in part. I've been
corresponding with a ham in Japan for almost a year now, exclusively by
packet. He recently moved, so I haven't received an updated home PBBS
address for him, but if you're interested, I can post the address for the PBBS
that he was on. As far as I can tell, packet is very active in japan. I haven't
seen any bulletins or anything like that originating in Japan, but regular
private type traffic is going and coming. By the way, I sent my messages
via the services of a satellite gateway station, using the REQSAT system.
I've had messages experience a turn-around time of less than four hours,
including satellite time! Contact your local PBBS sysop for more info on
the REQSAT system.

73 and good luck de Greg

Other way round, Dear Boy.

AX25 is based on X.25, which is used by some packet switched networks.

TCP/IP are protocols of the internet, and in amateur radio, often ride
on the back of AX25 frames.

Cheers !
Gareth.

Not to flame anyone, but what gateways won't take uuencoded files?
Uuencode outputs only printable 7bit characters that all uucp and
sendmail hosts (as well as Vax) will take. I have not sent anything
on packet as I'm not a HAM yet, but it would appear that the software
used in packet (AX25) is similar to the standards that the computer industry
uses. If that is the case, uuencode/uudecode should work in sending
binary data to anyone. Is this not true??

: any params "added" are lost. Removing the D connectors on the radio
: ports and the problem is solved - not very helpful though. It would seem
: that I've configured the attach commands incorrectly for my unsquelched
: radios. (D4-10 and IC251E - rx audio in the latter case being obtained from
: the receiver detector stage) My attach commands are:

JNOS40 in the DE has problems with noise on the RXD line causing more
interrupts than the CPU can deal with. If you want to attempt to use the
code, you will need to add a hardware mod to your modems to gate the RXD
with the DCD line. Basically, the CD in the attach line does not
function.

Also, if you're trying to use ver1.10 rel. you will find that it has
memory leaks and will end up locking up and requiring a manual push of the
ON/OFF to clear it. You might prefer totry to use the alpha version,
v0.99.1 from December 1993. It will work, but with "poor" performance.
I haven't noticed any version that has a CW ID.

FOR SALE

POWERFULL BAYCOM TYPE PACKET RADIO MODEM :

Based on chip AMD AM7911
Can work at 300 and 1200 bauds HF, VHF, UHF, SHF

Absolutly new, CI pro.

With software and documentation

Little price

PS : It's possible to trade it for TNC220 PacComm original
documentation.

3653. NET_Mac2.3.45.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-18 11:13:15 UTC
From: adam@iag.TNO.NL
Message-ID: <9410181113.AA07939@iag.tno.nl>
Source record: 47028

The Netherlands, October 18, 1994.
Hello dear reader,

Today I distributed NET_Mac2.3.45.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Enhance the test for bad AX.25 headers
- mac-tools.c was cleaned up by Ivo ON1XK
- Enhance the reboot_on_bad_date decision method
- Speed-up hostname lookups from the hosts.net file
- Let the watchcursor spin while copying mail-files
- In case of problems send a more explaining message to the screen
- Don't accept 'tcp reset' commands for sockets in 'Listen' state

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

Kind regards,

Adam PA2AGA (e-mail: adam@iag.tno.nl)
(or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

I thought that all telegraphy in Japan used the Katakana syllabary, not
Roman letters, and certainly is in the Japanese language, not English.
Please correct me if I am wrong. But if it is so, then the characters
would appear as gibberish on our screens.

The best and, really, only way to do this is to connect a TNC to the HP's port and run one of the numerous terminal programs available from the goodies disks and wuarchive.wustl.edu.

I have a packet program for the HP, which is just a terminal program written in User RPL. Sometime before the end of the year, if I ever get to it, I'll put together all the ham-radio related stuff into an FTP site somewhere.

I have thought long and hard about porting a SLIP implementation for portable amateur TCP/IP work, but I'm not sure if I'm insane enough to try it. :)

>to the rest of the world?
There are MANY PBBSes here, in several different categories. In
addition to the standard forwarding network, there are a fair number
of systems devoted to making public domain software available for
downloading. There are also well-connected TCP/IP networks and the
occasional DX packet cluster.

Within the forwarding network, the majority of the bulletins
posted are in Japanese and are not forwarded outside Japan. Given
current HF propagation international bulletin forwarding is pretty
tough here. We are relying on the satellites to handle most of the
international personal messages.

First Van, the stuff you quoted and attributed to me was actually from the original poster (WA2ISE, Robert Casey). Other than that, I've had no problem with corresponding with my buddy in Japan. He is Japanese, not a transplanted westerner. I originally responded to a CQ message from him, so that's how I got his original packet address.

3659. Steinbrecher radios

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-19 00:32:30 UTC
From: patricio@eehpx19.cen.uiuc.edu
Message-ID: <381peu$k72@vixen.cso.uiuc.edu>
Source record: 47033

Howdy,
I was just browsing through Quallcom's homepage and noticed an article extolling the virtues of Steinbrecher radios. What exactly are these? From what I gathered from the article, they are purely digital radios that use DSPs to digitize the incoming signal and then mess with it (modem/mux-demux etc). Is this correct? And what exactly is CDMA? Here is what I think: You take your data and split it up into different packets. You append a code to these packets that indicate what message they are from and what position they occupy in the message so that you can multiplex different data streams and then reconstruct them at the other end. Then you send these packets at the same time (relatively speaking) on different frequencies (spread spectrum?) so that instead of using the bandwidth of one frequency, you use the bandwidth of a whole bunch of frequencies so that your effective bandwidth is the aggregrate bandwidth of all these frequency channels combined. whew!!
Does this sound vaugely familiar or am I just missing the point entirely?
Thanks.

3660. Questions from new digital HAM.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-19 04:43:00 UTC
From: mece1us@rosie.uh.edu
Message-ID: <18OCT199423435718@rosie.uh.edu>
Source record: 46964

I am new to packet radio and want to use packet radio to access internet. I read some HAM magazines about packet radio and was confused by the type of radio that can transmit packet. I have a Macintosh computer and want to use it for packet radio. Here are some of the questions:

1) What kind of radio I should purchase for packet radio? What is HF radio? What is VHF/UHF radio? What is multimode UHF? Which type should I buy?

2) What kind of interface should it buy? I saw some TNC have very low baud rate about 1200 bp and some have 9600bp. Does the baud rate depends on the radio?

3) Can I use handheld radio for packet radio? If yes, what kind? If I use HF or VHF/UHF radio, do it need to have a tall tower (30' to 90' tower anntenna) ?

Thanks for any advice.
Tony

Let me know if you have any luck, I have been trying to get the system running on my PB-170/PK-232....

I would like to get a copy of autoexec.net from someone who actually has NET/MAC running. I just downloaded 2.3.45 and hope it may be a bit more clear about how to "customize" the file.

>to digitize the incoming signal and then mess with it (modem/mux-demux etc).
>Is this correct?

Steinbrecher has plans to make his "mini Cell" available in 1995. It basically is a $1,000,000 dollar cell site reduced in size to a large trunk which costs 1/10th as much. The implications should be pretty obvious: tighter cell density, higher data rates (multimedia potential), greater redundancy, longer battery back-up life, reduced installation costs, etc.

Steinbrecher digitizes a full swath (maybe 20 MHz) of spectrum and farms the whole bit-stream out to a bank of DSP processors, one for each "channel" you want to receive. All demodulation is done in software. It can deal with narrow band analog, TDMA digital or CDMA direct sequence spread spectrum. The "demodulation" algorithm is all that is changed. You don't need different hadware.

Analog Devices has recently released a vary fast ADC that allows you to digitize right at the IF stage. You can then demodulate using a DSP. Steinbrecher is using his own designs (I think) perhaps with help/funding from both Analog Devices and Qualcomm.

Is Steinbrecher a public company?? If so, where can I find them on the stock market page?

>And what exactly is CDMA?

The use of a form of direct sequence spread spectum modulation as applied to the North American cellular phone system.

Magazines that have already covered such issues are EE TIMES, ELECTRONIC DESIGN, HEWLETT-PACKARD JOURNAL, RF DESIGN, MICROWAVE JOURNAL, TELECOMMUNICATIONS, WIRELESS, CELLULAR BUSINESS, etc.

There are also many books comming out on the subject.
ATRECH HOUSE publishing has numerous text books (in the 80 to 120 dollar price range) covering cellular system design and

modulation techniques, digital RF, mobile communications and network design.

Other no-license required spread spectrum products on the market TODAY include wireless LANs (anywhere from a simple 9600 baud with a range of 200 feet on up to 1.5 Mega baud with a range of 30 miles), barcode scanners, cordless phones, etc.

Obviously, DSPs and ADCs will CONTINUE to get smaller, faster and cheaper. The pressure for efficient use of spectrum grows with the number of users. Frequency coordination using narrow-band techniques is a pain in the butt! The solution: spread spectrum RF.

3663. BPR2000 and Golay code

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-19 11:55:13 UTC
From: todd@wrtfac.day.cdc.COM
Message-ID: <395.9410191155@wrtfac.day.cdc.com>
Source record: 46980

I am working on building a transmitter controller for a Motorola "BPR 2000" Series display pager. I have some documentation from Motorola, but the paging format information lacks the detail I need to program the controller.

The first question is about the logic encoding. Is the carrier frequency just shifted to encode the ones and zeros? How much is the carrier shifted, and in what direction for a one or zero?

The next question is about the 18 preamble words. It is said that all 18 words are the same, and each word is 23 bits. Also that the preamble word is selected from a code set of ten. What are the ten preamble codes, and what part of the code plug number determines which of the ten is correct for a pager? Does the preamble word use the (23,12) Golay code, with 12 information bits and 11 parity bits?

The start code is made of two 23 bit words. What part of the code plug number determines the start code, and how is it encoded? Is the start code also 12 information bits, and 11 parity bits?

The address is also made of two 23 bit words. It would seem that part of the first 6 digits of the code plug number include the address. So how do you figure the address from the code plug number? Does the address use the (23,12) Golay, with 12 information bits, and 11 parity bits? If the address only has two words with 12 information bits each, then that is a total of 24 bits for the address, allowing a total of 16,777,215 addresses. The Motorola theory manual claims that only 400,000 address codes are possible, and this conflicts with what can be encoded into 24 bits. Even if they were using BCD in the 24 bits, that would allow 999999 possible addresses, so how did they come up with the 400,000 number?

Each pager has a 4-call capacity, with each call represented by one address. So each pager has 4 addresses. How are these determined? Which address is for "call 1" (tone-only source 1), "call 2" (tone-only source 2), "call 3" (tone & data source 1), and "call 4" (tone & data source 2)?

And then we have the data blocks of 8 words, 15 bits each. The data blocks use a (15.7) Bose, Chaudhuri, and Hocquenghem (BCH) code. What are the details of this BCH code? How many bits of information can be packed into 15 bits using BCH? How are the characters encoded? What characters are supported? (0-9,Abcd,space,dash)? Is the 1/2 bit space between data blocks always the opposite polarity of the next bit?

With the fields that use the (23,12) Golay format, how are the parity bits calculated?

The timing seems to be clear, 300 bits/sec for preamble, start, and address. With data and comma bits at 600 bits/sec. The one question I have is about

the 1/2 bit space before the data block, is that 1/2 of a 600 bits/sec, or 1/2 of a 300 bits/sec?

3665. ampr.org conventions?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-19 14:04:35 UTC
From: smckinty@sunicnc.France.Sun.COM
Message-ID: <38391j$pt3@uk-usenet.uk.sun.com>
Source record: 46944

I have several systems tied together on a home ethernet. I want to assign a domainname covering all of them, within the ampr.org domain.

Assuming I get the appropriate IP addresses, what is the convention for this? Would a domain of <mycallsign>.ampr.org be normal, with the systems configured as <system1>.<mycallsign>.ampr.org etc.?

Secondly can anyone tell me who is presently involved in assigning IP addresses in France? I was given a name a long time ago but he never replies to mail.

Thanks

Steve

3666. NOS: problem with ALIAS file

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-19 17:24:00 UTC
From: boulaisg@ingenierie.telecom.hydro.qc.ca
Message-ID: <CxxKC1.7yx@ireq.hydro.qc.ca>
Source record: 46978

Hi, in my ALIAS file of NOS I made an entry like this:
joe fred@abc123.edu

When I try to send a mail to "joe", the smtp module tries to send the
mail to abc123.edu, but to user "joe" instead of "fred". So the
receiver returns me a message telling that user "joe" is unknown.

I am using NOS11C-A.EXE

Is there any parameter to adjust that?

THANKS!!!

Send .COM files over e-mail and packet

brian@nothing.ucsd.edu (Brian Kantor) writes:
>Or better yet, instead of using UUENCODE, which uses characters that
>aren't going to survive some e-mail gateways, use the MIME standard
>that does. Why gosh-golly, if you use one of the standards, you might
>even find that you don't have to write code to use it, because your
>mailer might already understand it.
>
>But then, being compatable and following standards would take all the
>fun out of it, eh? That's why we're AMATEURS, right?
>- Brian

I believe that unless the recipient of the file/message has a MIME
decoder, they will be completly unable to use a MIME file sent to them.
There may be many Internet e-mail reader which automatically de-MIME
thnigs for you, be I'd bet very few hams on packet have even HEARD of
the MIME standard. CODET's purpose is to facilitate the sending a
binary file when the recipient has no more software than a terminal
program and a text editor. It's a little different than MIME's
purpose. I suppose I could have written the program to decode a MIMEed
.COM file, but I have seen UUENCODE used more than MIME, I don't know of
any packet TNC's that won't pass the characters I used, and what
difference does it make to the end user?

FOR SALE, TRADE, OR ????

One Model 28 ASR Teletype, complete.
Includes spare Model 28 RO less cabinet
i.e. a spare printer mechanism with base.

The 28 ASR has a regular friction feed platen.
The 28 RO is equipped with a pin feed platen,
vertical and horizontal tab kits (was used to print
airline tickets). If you really want it I have the
Teleticketer (tm) control box - essentially a 300 baud
autoanswer modem with answerback and a loop current generator.

This unit has been in storage in the back of my garage for the last
5-6 years when the current owner moved from a house into an
apartment and asked if he could store it in my garage. I believe it
was working at that time. He has since lost interest in it, and told
me to get rid of it. Manuals _might_ be available - if any interest
is shown, I will put the prospective buyer in touch with the current
owner.

>the systems configured as <system1>.<mycallsign>.ampr.org etc.?

Brian Kantor (brian@nothing.ucsd.edu I think) will have the right answer since he runs the ampr.org dns. I've been doing slip.callsign.ampr.org or linux.callsign.ampr.org, etc for local users. No one's complained yet. Check with Brian if your worried.

Yes thats true, but in ax25-packet we use 7PLUS instead of uuencode. Written
by a german Ham and contains a very smart error_handling_routin. If something
goes wrong in the forward 7PLUS makes an err-file that you can send back and
then you get a cor-file in return.

First, thanks to read this news,

Subject say all but I'm added these details :

- does someone have make some homebrew about that ?
- if the TM 732 can work at 9600 is it directly (original featured) or with a particular mod.

- notice I have a 732 E on witch I av perform the E5 mod (see file TM732.mod in /pub/hamradio/mods/kenwood on oak.oakland.edu)

Thanks and 73 to all

Source record: 46849

A friend of mine uses FBB5.15 via Baycom modem + TFPCX driver. We wonder if it is possible to run BPQ software in addition of actual status. Is there a way to run that combination with BPQ software? The next trouble is recognized in FBB5.15 when a user tries LIST-command within FBBDOS. Then FBB exits and re-boots itself immediately (?!). This problem didn't happen for a couple of years and started at once. Of course, all connected channels become disconnected as well as forward activities. What to do?

```
+---------------------------------------------------------------------------+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there are plenty of other wares on-line). Through
user support I hope to keep the latest and greatest ham software on-line.
The BBS also offers access to nearly all of the Internet (USENET) NetNews
groups, plus access to Internet E-Mail. Below is the information that is
needed in order to access the BBS via Telephone, Telnet, or FTP. Please
pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs

410-661-2475 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.34,V.FC,HST,V.42bis)

410-661-2598 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.34,V.FC,HST,V.42bis)

410-661-2648 - 1200/2400/4800/9600/14400/23000
(MNP2-5, V.32bis, V.42bis, Turbo-PEP)

TELNET/FTP - wb3ffv1.sed.csc.com (20.2.1.80)

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: UniBoard UNIX BBS Software (Version 1.30b)
Misc. Info: Machine is an Pentium-90/MP running UNIX System V Release 4.2
and features more than 3 Gigabytes of on-line file storage.
Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS]
WA7MBL BBS for the PC
W0RLI BBS for the PC
MSYS BBS for the PC running KISS TNC's
AA4RE BBS for the PC (plus BETA versions)
F6FBB BBS for the PC
```

G8BPQ PC-Node (Version 4.06)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /var/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic (ASCII Text)
-or-
uucp wb3ffv!~/FILES.Z /usr/spool/uucppublic (16-Bit Compressed)
-or-
uucp wb3ffv!~/FILES.gz /usr/spool/uucppublic (GNU Gzipped)

This will move a copy of my files listing into your uucppublic directory.

If you want to access the BBS via Telnet all you have to do is TELNET to wb3ffv1.sed.csc.com, and login is 'bbs' with no password required. To use anonymous FTP just ftp to wb3ffv1.sed.csc.com and login as 'anonymous'. This system is currently attached to the Internet via a dialup SLIP link, and should generally be available 24hrs, but at times the modem will drop the line. Also since this isn't the fastest link, I will be limiting the maximum number of anonymous sessions for the moment.

If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

Internet : howardl@wb3ffv.ampr.org | Howard D. Leadmon

3685. TAPR Internet Info

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-21 06:40:34 UTC
From: gjones@tcet.unt.edu
Message-ID: <387np2$lnp@hermes.unt.edu>
Source record: 46959

Periodic Posting ----------

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 1000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

lists (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name
should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP DSP Software Development Forum
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits

---

FTP users

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.hereford.ampr.org' in the directory
pub/hamradio/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Actually, I do understand most of this. I purposely asked questions in
a particular way to get Gary to explain it more clearly.

>
>1) You MUST build high-speed networks out of units that perform
>consistently, predictably, and in a nearly identical fashion. If you
>don't, you spend more time in establishing and maintaining the circuit than
>in moving the data.

Right. What concerns me is that the cellphone industry has been able to
produce a cheap, simple mechanism of radios (telephones) that perform
consistently, predictably and in a reliable fashion. I don't see this
as rocket science, but as purpose built equipment. Gary talks up GRAPES,
which is a purpose-built, single-source piece of equipment. It seems to
me that it is not beyond possibility to commercially produce a system which
can handle 56k at a reasonable cost.

>
>2) GRAPES is not a just modem, not just a radio, not just a digital (ONLY)
>modulation method. It IS an integration of all three items into a package
>with documented, useable (and rather impressive), and repeatable
>performance parameters.

When those pieces are available off-the-shelf, we might actually see a lot more networking at higher speeds. Not everyone is a builder. I certainly am, but if I am the only one building gear, that means there's nobody to talk to... 1200 buad packet is popular because enough people can buy it off the shelf.

>
>3) Amateur radio packet networks are BY DEFINITION multipoint networks
>that must operate reliably while having non-exclusive use of the radio
>channels. Data links made through telephone networks, conversely, are not
>shared and are not multi-point.
>

I totally disagree with this. Amateur Packet networks, as promoted by many regional networks around the country are similar in structure to the model used on the Internet: A series of WAN (point-to-point) links form a hub-and-spokes, interconnecting LANs (multi-access media such as Ethernet, etc.).

The structure everyone seems to want to build is high speed DEDICATED interconnect circuits (WAN point-to-point links) and open, user-access points of entry for the users. This means that there ARE non-multipoint "circuits" in the amateur radio networks. If we acknowledge these exist, why NOT build gear that handles that case well, at the expense of not having that gear handle multi-access operations?

When we build routers for the internet, there are ports for ethernet, token ring, and FDDI, which handle multiple stations per port, and there are interfaces which support dedicated point-to-point links using HDLC over phone lines, or whatever is available (Frame relay, X.25 PSTNs, etc.). Even the networks like Frame Relay which allow multiple connects on the HDLC lines typically have a small list of "known" "circuits" that are configured.

Amateur Radio networking actually appears to suffer from the belief that one technology must be used throughout. In my part of the country, the AX.25 TNCs at 1200 (and occasionally 9600) bps are used to form both backbone links and local access. It sounds like this model is used in most places, regardless of the bit rate. I contend this is less than optimal.

3688. Sync vs Async HDLC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-21 14:09:18 UTC
From: munts@asgp.uafsoe.alaska.edu
Message-ID: <munts.112.0038E459@asgp.uafsoe.alaska.edu>
Source record: 46936

I have been giving a lot of thought to Internet/packet bridge systems lately. As part of this process I have studied the data sheets for a lot of HDLC chips. None of them are particularly nice to use compared to simple UARTS.

That leads me to the question: What advantage is there to synchronous HDLC in amateur packet TCP/IP? Why not just use asynchronous HDLC instead?

The only advantages I see are the polarity insensitivity of NRZI coding and the lower framing overhead of HDLC. To me, these don't justify the aggravation of dealing with synchronous HDLC hardware.

3689. Conversion of Commercial Radios

>
You'll find that packet hams use a somewhat similar program called "7plus".
It has a somewhat wider set of characters than uuencode, and also has
CRC error detection and some correction. If it can't correct an error, it
sends an error file back to the orginator with a request for him to run
7plus to create a correction file and send it out to you. You then run 7plus
again and now it knows how to fix the errors (assuming no errors in the
correction file!).

I ftp'ed it from (I forgot where), garbo.uwasa.fi or maybe oak.oakland.edu
I have a copy here if it isn't there, I could e-mail it.

From : AB6GQ@KM6PX.#NOCAL.CA.USA.NOAM
To : SYSOP@NCPA

Hello dedicated SYSOPs. My name is Fred Sober, and I am the Official
Observer Coordinator for the Sacramento Valley Section of the ARRL. I
am sending this bulletin at the suggestion of some of the local BBS
SYSOPs, who thought you should be aware of the following info:

Approximately one year ago, I initiated a series of correspondance
with John B. Johnson, Chief of the Private Radio Bureau of the FCC.
Due to the confusion of Amateur Radio Packet BBS users regarding
the permissible message content of bulletins, and the growing
tendency to abuse the system, we requested FCC clarification regarding
the definition of "One-Way Bulletins" and "Bulletin Message Content"
as it specifically applied to Amateur Packet Radio. The position of
the FCC is as follows:

1. Any packet message or bulletin sent to ANYTHING other than another
specific Amateur Callsign (EXCLUDING the callsign of the BBS) is
considered to be a "One-Way Bulletin," and as such must comply
with Part 97 in terms of permissible message content for such
bulletins. Also stated was the definition of "anything" (above),
which is such addressing as to ALL, ALLUS, ALLCA, Food, Drugs,
Guns, or anything else, other than another specific amateur
callsign.

2. The information sent MUST NOT BE INTENDED for anyone but other
licensed Amateur. "Intent" is determined by "Message Content," not
by the mental intent of the message originator.

3. The Information sent MUST BE RELATED TO, AND OF INTEREST TO
AMATEUR RADIO OPERATORS ONLY!

4. Any Packet Bulletin which contains material which relates to anything not directly related to amateur radio, or of interest to amateur radio operators only, is considered to be "Broadcasting." This includes material on Cars, Guns, Politics, Food, Jokes, Current Events, etc. etc. etc.

In the above listing the emphasis was supplied by the FCC in the letter I have on file.

For further clarification you may refer to the "FCC Rule Book" published by the ARRL, (1993 Edition). On Pages 6-6 and 6-7 the topic of information bulletins on packet radio is discussed. The highlighted section in the box is a paraphrase of the letters I have on file from the FCC.

Upon notifying the ARRL Rules Department of this Clarification, they made the determination that the abuses in this regard were] so widely spread and prevalent, that the League and the Official Observers needed to undertake an educational effort regarding this ruling, prior to beginning a notification effort on the individual offenders. This would prevent an overwhelming overload of the OO Program.

Some BBS SYSOPS, such as KM6PX, upon learning of this clarification voluntarily and unilaterally decided to set the clarified standards as the operating standard for their BBS's. They began editing and deleting any bulletin traffic which did not comply with the above.

Technically, with the latest rulings by the FCC, the BBS SYSOP is jointly responsible for violations of Part 97, by operators which originate a bulletin through their BBS into the system.

Technically, the FCC can at any time begin issuing NAL's to the Operators and SYSOPS for any bulletins in violation of the above.

Practically, I do not know when the OO Notices and NAL's may start being issued, but it behooves you as a BBS SYSOP to be aware of the current rulings and facts, and hopefully to be in compliance prior to any notification or enforcement actions being taken.

73, keep up the good work! Fred Sober, AB6GQ

*** Yes, Fred, keep up the good work. I'm glad that you are doing all

*** that you can to make Amateur radio packet boring.

Now I THINK it was Bob (N6FRI), who replied with this...

>>*** Yes, Fred, keep up the good work. I'm glad that you are doing all
>>*** that you can to make Amateur radio packet boring.

A BIG QSL on the "boring" aspect, OM!

My OPINION is that the message "content" is just as important (if not
more so) as the method by which the data is transferred. I LOVE the
freedom of the Internet.

I have enough of a problem trying to keep my interest in advancing the
amateur radio sota (via cooperative investment in packet infrastructure,
TCPIP/NOS, SS, etc) alive here in Wisconsin what with the total lack of
interest by the vast majority of the AX.25 1200 baud beacon fanatics
around here. Most just don't care about cooperative INVESTMENT (yes,
this takes $$$) in a high-speed backbone.

Now lets make that investment even LESS attractive by LIMITING the type
of traffic to that typical, BORING amateur blather about the weather
and your current health problems. I sware the FCC WANTS us
to die! They'll then have even more spectrum to auction off.

There is a difference between BROADCASTING and POSTING AN ARTICLE
so as to encourage intelligent discussion. While SOME packet
posts are in poor taste (and approach broadcasting), many result
in interesting discussion threads (and yes, a few flame wars).

BIG NEWS: people have different opinions on almost every topic.
One of the advantages of living in a "free" country is the exchange
of those ideas in an open manor.

Commercial telecomm looks better and better every day. Then again,
I'm sure we'll see Internet regulated and censored soon enough.

Maybe those in rec.radio,pirate are right! ;-))

The tar.z format is a gzip'ed tar file. Get gzip from SimTel. If you
don't have a MSDOS tar, then get that from SimTel too. That is, if
you can't find your zip'ed version.

I think it's always in the benefit of the ARS when a clarification
of the rules are made in advance to violation notices being handed
out. All it probably took was for a few to stretch what was considered
appropriate use of packet for this clarification to be made.

On the back of our license it says, in part, `Operation of the station
shall be in accordance with Part 97 of the Commission's Rules.' Our
signature on the front binds us to this statement.

If someone has a problem with this OO and this clarification, I hear
that packet might now be in use on the CB frequencies....

Bear in mind that what is being discussed are one-way bulletins. In
legitimate discussion, the FCC has very little power to regulate anything. I
think if their power were ever challenged in that regard, that under the
first amendment, it might becomes very difficult to censor anything... :)

That said, IANAL, so maybe I'm full of crap. :)

Speed comes into it as well. You can handle a synchronous link far
easier with DMA than an async link since detection of end-of-packet is
built-in.

A friend of mine is looking for hams that are interested in discussing the radio aspect of packet radio. i.e., tx delays, sythesized radio on packet, group delays, etc. He's interested in putting the radio back into packet radio.

If you are interested in the radio side of the hobby and not just BBS forwarding, and running packet dx clusters, bbs, nodes, etc just send him an e-mail or send it to too so I can relay the info.

His packet radio address is VE2BMQ@VE2FKB, his name is Burt. He'S built a digital regen repeater and installed many nodes on 2m and UHF. You can also try ve2bmq%ve2fkb@bbs.ve2ums.ampr.org on the internet.
IF you could also send me a copy in case the other 2 methods don't work.

thanks Dino

Check out term.

There may be other comm programs, too.

good point. it's probably too late for the 1995 handbook, but certainly discussions of message formats and such should probably be in the 1996 handbook (or at least an updated version of a packet radio book...)

of course, if it means bumping the crystal set and DC receiver projects, it won't be done

anyone else think it's time for a CD Handbook?

>This message has been brought to you by...

Anyone have any success with NNTP under JNOS (1.10 or otherwise)? We, on our LAN are trying to adapt NNTP for use over the 44.24.112. LAN. We have an Internet provider where we can subscribe to the news but getting it to go out is what we're working on now.

Any help would be GREATLY appreciated from anyone seasoned in NNTP.

Thanks in advance,

BB

Oops, the last one got sent out prematurely!

Has anyone heard of the development that Johan has had with Now for Windows? I KNOW quite a few folks are looking forward to this release. Imagine using a mouse within NOS to do the FTP, Telnet, Pings etc. Don't get me wrong, I don't mind command lines and I certainly don't mind time at the keyboard but,,,

Hmmm, whats the method to subscribe to NOS_BBS at UCSD? I keep looking at the FTP site in "incoming" but no news or beta files there yet :-)

Thanks again and 73,

BB

Bob Wilkins n6fri (rwilkins@ccnet.com) wrote:
: This was found floating on the Amateur Packet BBS system. What do you think?

I think this guy is a weenie with nothing better to do with his life. He should tear up his license and get the hell off the air if he doesn't like it. You have to remember, this is HIS interpretation of the rules. In the bbssig mailing list they posted the copies of the letters from the FCC and you'll see clearly that most of what this guy says is bent out of shape into something that he wants. Funny that anyone that reads the letters from the FCC and also Part 97 will see it differently.

I'm an experimenter and have been licensed for over 15 1/2 years now. I've seen all kinds of people come in and think they own this hobby and they have nothing better to do with their lives but to look for something illegal. If you are looking all the time you'll find something whether it's legal or not. Your mind becomes distorted when you spend all day looking for errors and trying to distort the rules to make it what you are trying to see. The FCC is not some evil government group trying to get rid of ham radio. I've talked to the same person that he has talked to before on the phone and the FCC is very flexible with the rules and ☐{willing to cooperate with us to make them work. If we feel that a rule needs to exist or a clarification of a rule, submit it or talk to them about it. I dont' go around looking for what he does because I grew out of that phase years ago, instead I'm more interested in doing the new and more advanced technology (the stuff that scares the hell out of people like this guy) and if it's not legal or there is a doubt, then I'll try to change it or get a waiver (STA).

On 'amateur radio related' give me a break. If everything in this hobby had to be ham radio related then who would want to be in this hobby. I'd set up shop in the CB band instead along with most other hams. This is communications plain and simple, whether it's CW, SSB, digital modes, ATV, etc... We experiment. I run TCP/IP and if you look at what it does adn it's legal for ham radio, I say it ham radio related. Anything I send through is ham radio related and I can easily bend or distort any rule to prove that too if challenged just like this person is trying to do to prove it is illegal.

Most people like this end up just getting treated badly for trying to wreck the hobby and put more restrictions on it and it ends up just hurting them. I've seen this same thing over and over again and it never seems to stop. Maybe a year or two from now he'll probably end up just changing his callsign and try to start over like other people I know personally that were just like him.

> 73, keep up the good work! Fred Sober, AB6GQ

Dear Mr. Sober, AB6GQ.

A message purporting to be from you has been sent to SYSOP@NCPA, and
has been relayed to the amateur radio community in the United Kingdom.

In it you state that you have `initiated' correspondence with the FCC
which has resulted in a proclamation that Radio Amateurs in the U.S.
may only use the packet radio network to send information `Related to,
AND of interest to Amateur Radio operators only'

Could you please confirm whether this restriction applies to ALL
communications by U.S. Radio Amateurs, whether by Data, Phone, or CW ??

The consequences to your official observer corps could be rather
severe, as for example, Radio Amateurs are `struck off' for mentioning
their names, or details of their families, home and work life,
local weather conditions (inappropriate on HF) or indeed for expressing
`best wishes' which are clearly not of technical benefit to the hobby
of amateur radio. The Radio Amateur community in the U.S could
be wiped out to extinction within a week if your `official observers'
are right on the ball.

If you are indeed responsible for the above, please refrain from signing `73' as you have chosen to do at the end of your message.

Popular Amateur folklore in the UK has it that during the time the nazi party were in power in Germany, and for the short time that amateur radio was permitted, German amateurs would use `HH' instead of 73. After the war, an extra `dit' was added to both characters to make `55'

I would suggest that the above being true, you sign 55, oh ....
and the meaning of `HH' ?? Heil Hitler !

73, (my UK licence allows me to make `remarks of a personal character' - even on Packet Radio)

Gareth Rowlands, G4HIP. G4HIP@G8LWS.GB7HSN.#32.GBR.EU

On the SSB phone bands, or 2M FM repeaters, you can hear a lot of stuff
not related to ham radio (weather, health problems, cars, name it).
No "business" or "commercial" traffic of course. So, if someone posts
a food article, image files, or a debate on something, is that significantly
different than the voice stuff? One has phone nets,where each ham in it
is talking to multiple reciever hams. On packet, I've recieved many
thank you's from hams after posting several "comet hits Jupiter" image
files. That's a kind of 2 way. I don't think the FCC is that worried
about it. We're not charging money for packet posts, it's just a big
exchange of various kinds of non-commercial information.

Call out the thought police. Obviously US amateurs are going to have to
be careful how they think in future.

>3. The Information sent MUST BE RELATED TO, AND OF INTEREST TO
>AMATEUR RADIO OPERATORS ONLY!
>
Well, if you cut out everything that wasn't of interest to *this*
amateur radio operator then there would be about ten bulls per day. If
you then removed those which weren't radio-related it would be down to
one. Looking at the above from another point of view, does the wording
imply that if the information is also of interest to non-amateurs, it is
breaking the rules?

In summary, it looks like this chap may well go down in history as the
person who killed packet radio as a useful mode in the US. Just wait
until he listens to 80M and hears all the non-radio-related ragchewing
on there.

Hello guys and gals,

A few questions:

1) Being a newby I've heard some thing about 'ampr.org'. I think I know what
it is but can somebody tell me more about it.

2) I would like to go into packet radio but HAM tranceivers are quite
expensive. Therefore I would like to modify an old 27Mc tranceiver for
use with packet radio simply by putting a 27Mc <> 144Mc transverter after
it.

This can be done ofcourse, but since the CB set has a fairly small IF
I was wondering wich speeds can be achieved with such a setup.

Greetings,

Feico de PE1OHM

Larry is right. We are talking about the guy who posts his mother's
cookie recipe to ALL@USBBS, not outlawing the 40-meter Cookie Net.

As many have said, this newsgroup is more relaxed as far as what we
can and can't post. What would happen, though, if that guy posted a
cookie recipe on rec.radio.amateur.misc? He'd get flamed off the net.
He would be told that this is not the place to post cookie recipes.

Ditto for the Packet BBS system.

Try just typing TOR and hit the F10 Key, think that is the way it is done
in gold.

TOR mode is probably only useful for CQ's based on the literature
I received with the firmware.

In general the Baycom "TNC" is little more than a modem for your radio. All of the smarts are provided in your computer. As a result you are bound to the computer and operating systems supported by the Baycom software. A viable alternative for some, I guess.

On the other hand, a real TNC has a CPU and serial port so it functions independantly of your computer. Any computer with a serial port can use a real TNC the same as it might use a telephone line modem. Most TNC's come with built-in personal mailbox software so your friends can leave or pick up messages on your TNC with your computer turned off.

The DRSI DPK-2 and Kantronics KPC-3 sell for the same as the MFJ-1270 and most will agree their build quality is better than the MFJ. The DRSI and MFJ are TAPR TNC-2 clones so they are more useful if you get tired of packet and donate them to your local packet network backbone.

The point is being missed. Are packet bulletins addressed to either "all" or a like form of "all" (MUSIC, SEWING, CRAFTS, NAFTA, etc.) indeed informational bulletins?

Is there a difference between:

1. My tuning in a W1AW transmission and listening to an ARRL bulletin.
2. My tuning in a packet BBS station and reading an ARRL bulletin.

I submit that both forms of the bulletin are the same. I end up with identical information. In both cases, the bulletin is an "informational bulletin". In both cases, the transmission is one-way. There is not an exchange between two stations. The form that the data takes is irrelevant. The mode upon which the data is transferred is again irrelevant.

Then, what is the difference between:

1. My tuning in a packet BBS and reading an ARRL bulletin.
2. My tuning in a packet BBS and reading a bulletin about cooking.

I again submit that both forms of bulletin are identical. Even a request (buried in the recipe) from a cook for more cooks to respond is nothing but a "CQ" and, again, a one-way flow of information.

If there is no difference, could W1AW begin harassing Clinton about his viewpoints on foreign trade (in their bulletins)? Could they discuss cooking or sewing? We must agree that the rules would prohibit such bulletins.

Because we use error correction causing a "connect" to be required does not change the fact that a packet radio bulletin is a one way transmission. It is not addressed to a ham. It is addressed to the ham community, to the general public, just like the W1AW bulletins. The changing of the definition of a "bulletin" due to the medium upon which it is transferred is not proper.

The OO is then correct. Packet bulletins are informational bulletins and subject to the restrictions of that definition. Information outside of that which is of direct interest to the amateur service is not allowed.

I would be pleased to see the FCC interact with the amateur service by way of NALs. Our ability to self police our service would be greatly facilitated by occasional guidance.

Please, if you are going to reply, don't do a line-by-line rebuttal.
Write something original. You also might note that the thread deals
with BULLETINS, not QSOs.

73,
Steve

24-October-1994

Version 2.31b of the G8NPF Personal Message System (NPFPMS) is now available as a self-exploding file 'NPF230B.EXE'. NPFPMS is designed to be used with G8BPQ node software (version 4.05 or greater) on PC-AT class (286 and higher) machines. Improvements since the last Internet release (version 2.21e) include:-

+ A new version of compiler to reduce code size.

+ Many enhancements to configurable options.

The PMS code is available from the following ftp sites :-

ftp.demon.co.uk (158.152.1.69) as /pub/ham/npf213b.exe
ftp.funet.fi (128.214.248.6) as /pub/ham/packet/misc/npf213b.exe

Uploaded with permission, and on behalf of, the author Ted Harrison G8NPF (tedharrison@cix.compulink.co.uk).

3730. 9.6 Kbd in 15 Khz?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-24 22:42:12 UTC
From: Rick Whiting <rick_whiting@atk.com>
Message-ID: <1994Oct24.224212.20357@omega.atk.com>
Source record: 46937

This is a follow-up question regarding coordinating full duplex digital facilities on traditional voice repeater pairs.

Is it feasible, particularly with respect to adjacent channel interference, to operate a 9.6 KBd digital facility in a 15 Khz channel, i.e., with a G3RUH style modem?

I ask because it appears that the reported successful mingling of 9.6 Kbd digital facilities with voice repeaters on 2M were in geographical areas (or sub-bands) with 20 KHz channels. In this part of the country the 2M repeater coordination plan uses 15 Khz channels above 145 MHz.

I believe the designers of the current 9.6 Kbd modems worked pretty hard to get the signal into a 20 Khz channel (including guard bands). Thus, I wonder what the operational penalty is for squeezing the channel down by 25%, e.g., on S/N requirements, ability to adapt radios, etc.

Comments and suggestions based on practical experience, measurement, and/or theoretical prognostication will be greatly appreciated.

As is often the case, people have a tendency to flame before they get all
the facts.

This weekend I attended the Northern California BBS Sysops meeting at
Pacificon. This issue and the people involved live in this area and
are known to some of the Sysops, so let me try to give everyone a little
more direct info.

Fred Sober, as OO, was asked a question by a local ham:

If broadcast bulletins of non-amateur subjects are illegal on voice,
why is it OK on packet?

Fred did not know the answer (nether would I), so he started up the ARRL
chain of commands asking the Section Manager etc. Each level in turn
said that they did not know the answer and referred him up to the next
level. Finally he was talking to ARRL HQ.

They also said they did not know and referred him to the FCC and asked him
to "let them know what the FCC says." (I don't know who I was at HQ that
said this, but it sure does not sound like a good idea to me). So,
Fred started corresponding with the FCC. The results he got were right
out of Part 97.

Even then, Fred attempted to keep this quite until it could be discussed
and perhaps a solution found. He posted a "Private" Sysop only bulletin
for Northern California only to make Sysops aware of the situation. A
certain Sysop in the area re-addressed the message to a regular bulletin
with world wide distribution. Now the hate mail is coming in to Fred.

Now I don't like the results from the FCC. But I do not blame the messenger.
Fred was responding in a proper manor to a legitimate question directly
involved with his OO duties. All of this is documented with copies of the
correspondence. Several of the local Sysops have seen it and were aware
of this as it happened over the last year.

So next time it would be nice if some people would try to find out the facts
before they start slinging mud.

I think you are nitpicking about the wrong thing. The reason that part 97 restricts "broadcasting" has little to do with the actual content (even though content is used as one of the restrictors) and much to do with bandwidth and interference. The part 97 rules limiting broadcasting were written with HF in mind and are concerned with preventing stations from just parking on one frequency and blathering away for hours on end even if no one is listening. A packet BBS does not do this. It only sends a bulletin on demand and when there is known to be a receiving station. Also, packet BBSes operate at VHF and above, where band space is not at so great a premium and they do share the frequency with other stations if all parameters are set properly.

I note also that in spite of part 97, we seem to have plenty of "broadcasters" running off on 20 m. so why doesn't this OO do something about THAT! It would be a much greater service to the amateur radio service to clean up that garbage than it is to hassle VHF packet stations.

The ampr.org is made up of all the 44.x.x.x IP Addresses and has been
set up for Amateur Radio operators. Some part of the ampr.org are directly
accisible from the Internet (dfwgate.ampr.org for example), some are
e-mail accisible from the Internet (user@kf5mg.ampr.org for example)
and some parts are cut off completly.

Please Think about this and you will see that it wont work. As you
know everybody sees what is sent over the radio. This means that
you are sending your password in clear text for everyone to see.
Not a good idea.

There are some options but as usual it cost money. What you want is
a password that can be used only once or some type of changle responce
system where your users have some type of one time password generator.
Both of there ideas will cost you more money than you might want to
spend. Like $100's or $1000's.

A similar problem exist with people logging on over nets. Passwords
etc are shipped 1000's of miles and anyone monitoring the packets and addresses
of these packets can pick up the response to the "password:" prompt. This
has all been handled, although I don't know how. MIT has a process called
something like CEREBOS (it's that name of the dog that guards hell in
greek mythology) which handles the password bit. Go ask your unix guru.

:

A "CQ" is indeed defined as a one-way transmission in 97.111. It is allowed.
Appending a "CQ" to a signature file would be an obvious attempt to get
around the content being a bulletin.

Assuming this is a European FM CB, 1200 baud is sure, 2400 baud is
likely, and 9600 baud will require modifications to the set. If it's
an AM CB like we are blessed with in the States, then it won't interoperate
with other amateur signals without first modifying it to FM. There are
kits available to do that for the more popular board sets such as those
used in Midland radios.

I disagree. You have to do more than "tune in" to a packet BBS. You
have to establish a two way connection and *request* the information.
It's third party traffic pure and simple. Two amateur stations are
participating in information exchange.

>Then, what is the difference between:
>
>1. My tuning in a packet BBS and reading an ARRL bulletin.

Again, you do more than "tune in", you must *request* the
information. Unlike broadcast, you are an active participant
in the process. A CQ is not a true one way transmission. It
is an intergal part of establishing a two way exchange of
information. It's a solicitation for a response.

>If there is no difference, could W1AW begin harassing Clinton about
>his viewpoints on foreign trade (in their bulletins)? Could they
>discuss cooking or sewing? We must agree that the rules would

Yes, because they are true broadcasts. Anyone passively listening
gets them. Packet bulletins are fundamentally different in that

active participation is required.

>Because we use error correction causing a "connect" to be required does
>not change the fact that a packet radio bulletin is a one way transmission.
>It is not addressed to a ham. It is addressed to the ham community,
>to the general public, just like the W1AW bulletins. The changing of

>transferred is not proper.

If you take this line, then you must squelch all roundtable and net
operations. Just like the packet bulletin, each station makes statements
to the participants and awaits responses from whomever is interested
in the topic. Packet bulletins are no different except that they are
not conducted in realtime. They are simply the packet version of the
roundtable or net. If the topic of disscussion is allowable on a net
or roundtable, it's also appropriate for packet bulletins.

Bulletin is misleading terminology in this respect. The destination
address header should instead be considered as a special interest
group address, or as we call it here in netnews, a newsgroup. In
other amateur use, we'd call it a net or roundtable. The key is that
people have to "check in" to participate, on packet or on a voice
net. It's not primarily a passive activity like listening to W1AW.
With W1AW all you *can* do is listen, because they don't monitor
the frequencies on which they broadcast.

>Howard Anders VK3AYV

All you need is a TU (Terminal Unit, the RTTY name for a plain dumb modem), and some machine that speaks Baudot. Today that usually is a computer of some sort, though a mechanical teletype also works of course. The computer need not cost $3000, but it does need a keyboard and a screen, and software to decode/encode Baudot to video characters and from keystrokes. Something as simple and obsolete as a Commodore C64 will suffice.

I don't think that would be a good idea. I think you should be able
to talk about whatever you feel like talking about. The same is true
for packet, or any other mode. It's just that indiscriminately
posting bulletins to every PBBS in the country about things that are
not of interest to the general ham population is a waste of resources
and annoying. Depending on the interpretation of 97.113(b), it might
also be illegal.

Do you have a reference for this assertion? I rather suspect
that you're guessing, and I believe that you are wrong.

Be that as it may, the rules being applied are not new. I
doubt whether the FCC's interpretation as expressed differes
(significantly) from that which they have held for years. That many
of us, apparently, want packet radio to be a free usenet feed matters
not. The FCC rules mean what the FCC says they mean, not what we
think that we can imply by spin-doctoring their wording and applying
multiple rules out of context.

Some people have been likening packet BBS postings to "ROUND
TABLES" (an FCC defined term) rather than to "BULLETINS". The FCC
isn't even being inconsistant in putting them in the latter category:
in a round table, transmissions other than call-ups (CQs are an
explicit exception to the 1 way rules) are not intentionally made
unless the sender knows that there is at least one specific individual
out there, by way of his check-in, copying the transmission. A BBS
posting is totally in the blind.

The HAM radio service was not created to allow us to save a
few bucks by avoiding providers of commercial communications services.
If you want to post and read about cooking, etc., pay for a Compu$erve
account, or equivelent, or, like me, spunge off of your employer's
internet connection if he allows it. You won't convince me that the
FCC is obligated to let you do it under the auspices of your US
amateur radio license.

>
>Ditto for the Packet BBS system.
>
There is a difference between packet and the Internet newsgroups.
Packet is not split up into many multiple news catagories like the
Internet is. For many people out there, packet is the ONLY
BBS "network" they have access to. And some would be interested in
cookie recipes. There isn't a packet "food.recipes.cookies group,
all posts on all topics show up on a packet BBS at random, no "groups".
Imagine the Internet if there was only ONE newsgroup! Packet is set
up like a small scale Internet with only one newsgroup.

Maybe, if someone writes new packet BBS software, they could establish
"newsgroups". Like maybe: dx, mods, for_sale, wanted, help, recipes,
images, IBMPC (small 7plus-ed programs, small meaning <20K max), Mac,
debate (for those gun and such arguements), etc.

I suppose someone could "simulate" the above now by grouping posts
by the keyword in the to:<keyword>@<area>, like "images@ww, forsale@usa,
wanted@nocal, and such. You connect to this new packet BBS, it lists
all the <keywords> in all the posts that have arrived since last time
you logged in. Then you tell the BBS which <keyword> "group you
want to list. Looks a little like a newsgroup.

Anyone done this?

3751. X1JR2 Patch Problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-26 12:22:59 UTC
From: jkbe@lena
Message-ID: <CyA52D.At3@nntpa.cb.att.com>
Source record: 46845

I received a phone call last night from someone that
is having trouble patching X1JR2 with the
information that was posted here. The problem is that
at location 0x13d8 the byte is not 2a hex. I duplicated
what he has done and I get the same results.

These are the steps....

In DOS "debug THENET1.X1J" (X1JR2 release)
At the "-" prompt type "d 14d8"
The file is displayed starting with 13d8.
The bytes starting with 13d8 are: 18 2a 2a 8e 82 11 02 00

I have even converted the file to hex with Unix
od and at location 0x13d8 I find the same pattern.

What are we doing wrong?

Actually there is a packet driver for "Baycom" type modems
which will work with NOS. It was written by a Polish ham (Pawel
Jalocha, SR9VRC).

I have used it successfully but not extensively so I can say
for sure that it does work but I don't claim to know all about
it. I had little (no :-) success on an "turbo" XT machine but
a 386/33 seemed able to keep up.

You can find this software on ftp.ucsd.edu in
/hamradio/packet/tcpip/ax25drv.zip.4-jan-93

You could use the same system that is used in X1J and other nodes which have
a sysop command. Basically there is a LONG string entered as a password in
the software, which is also known by the user. When the user logs on, the bbs
would send a random series of numbers - say five. The user sends back the
characters pointed to by those numbers. If you change the password
regularly, it should provide sufficient security.

IANAL (thank God!); I don't know. However, this is what is being used on
TheNet, X1J and other systems right now, so it probably is legal.

<< text deleted >>

>What are we doing wrong?
>
>John, WB3ESS
>

What's wrong is that it is 14d9 not 14d8 (Not sure where the 8
came from, don't *think* it was a typo but apologies if so)

The code from 14d8 is :

```
14d8 jr xx
ld hl, (xxxx)
ld de,2
call xxxx
```

So at 14d8 is the opcode (jump relative) and 14d9 is the offset
for the jump. The patch is to change the jump address, so the byte
to patch is at the next location, 14d9.

Regards

Dave

3757. More on Bulletins

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-26 14:24:21 UTC
From: mack@mails.imed.COM
Message-ID: <9409267831.AA783185999@mails.imed.com>
Source record: 46847

Ahem.

Time for me to weigh in with my opinion.

I agree with several whose posts were in digest #352 that a bulletin is not really broadcasting in the sense that W1AW bulletins are broadcasting. If you stop to think a moment you will realize that ONLY direct keyboard to keyboard chats are QSO's in the same sense that a voice (or CW or RTTY) QSO is. Typically the communications are far removed from real time. If you use the requirement for the receiving operator to "consume" the information in real time then almost ALL packet communications are broadcasts!

The voice net (short for network!) analog is an appropriate way to view all packet operation. You "join the net" simply by putting a packet station on a particular frequency and turning on the power!

The trouble is that this is a new mode that is similar to old ways of operating, but not exactly. The concept of "broadcasting" is an OLD concept that makes sense for voice and other OLD modes. However, if there is an analogous type of operation that the government wants to prohibit they should strictly define a new term that is appropriate for this new mode of operation. Don't try to fit size 10 feet into size 5 shoes.

>I think you see it a little pessimistic. First the idea of the baycom
>modem is, that it is not the best thing to use your 386 (486)
>as a dumb terminal and letting the Z80 in the TNC do all the work.

if i'm running a multitasking/multiuser system like a unix or os/2 or even dos/windows...trying to run a software tnc when trying to do something else isn't the best thing either. in the case at home, i can run the tnc comm program while running a bunch of other stuff -- that way i can monitor the traffic w/o having to dedicate the superpowerful computer (386/33, yeah right) to do a DSP job.

If I use a smart TNC, i can use the computer, the dumb terminal, one of those handheld computers, another modem tied to the phone line, etc. to provide input to the TNC since it follows a standard for hooking equipment together.

baycom won't do that.

baycom has it's place -- it does let you get on packet but at a loss of flexibility and cost of support hardware.

>What we need to do is find a way to con the producers of Power Rangers to have
>one of the rangers get into Amateur Radio...then we'd have 45,000 kids that

actually, it might already be "in the can" so to speak.

Billy (great choice of names, eh?) is the "Donatello" of the MMPM group. Of course using a radio to outwit rita might create a story situation where the zords aren't called up (and meaning they might have to shoot 3 minutes of new film...something they avoid at all costs). but given that Billy works with technical stuff, it might just be needed to have the right words in the voice overs - everyone knows that ham shacks are raggedy, old, rack-mounted, haywire junk piles anyway...the blue ranger would never have that...8)

of course, there's the "easy kill" of giving the CW/AM walkie talkie toy makers information about amateur radio to blow into the toy packages...but we can't afford to make the millions of inserts required for those...or buy off GE to have the (800)-32-new-ham number stuck on the back of the box.

of course, if there's a MMPM communicator (seen the dragon zord controller/ flute), does it even do morse code at all? some of the new 49 MHz toys don't do that any more...as in the AT&T cellphone lookalikes.

Greetings!

I have written a published article in the ham radio magazine QST
(published by the American Radio Relay League) on ham radio and the
Internet. The whole series is called "Exploring The Internet-Part x"
where 'x' is one of the parts shown below:

Part 1 (written by Steve Ford, my editor) specifically discusses what the
Internet is. This was in the September 1994 issue.

Part 2 (also written by Steve ford) describes what the ARRL has to offer.
This was in the October 1994 issue.

Parts 3 and 4 (both written by me, Scott Ehrlich) discuss some of the
TCP/IP commands which can be used, with an emphasis on accessing ham radio
information.
Part 3 is in the November 1994 issue (just coming out now), and part 4
will be in the upcoming December 1994 issue.

If you miss the series, don't have access to QST, or simply want
reprints, here is the information (provided by Steve Ford):

Article copies are $3 per article. The contact person is:

What 'One Way' bulletins??? What this idiot OO forgets is the each and every
'transmission' is a two way, point to point, ham to ham communication.
I sent the message to my local BBS (point to point) - it sends it to a ham
that requests it (point to point again). Where's the broadcasting? Where's
the "one way" transmission? That what the FCC regulates, anyhow. Are they
saying I can't put an open letter or editorial on packet since the subject
matter doesn't involve RF or electrons? I don't think so. Since only hams
can access the messages via a pt-pt connection, there's no broadcasting.
If they want to limit content, go after the "last operation/what I had for
breakfast" OF's.

3764. Packet stations in/near Durham, NC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-26 20:31:19 UTC
From: knauer@intel.com
Message-ID: <knauer.783203479@ibeam>
Source record: 46850

Greetings all.

I'll be in North Carolina this weekend, and am wondering if anyone might have a list of packet BBSs that are potentially reachable from Durham and points east. Is there any packet backbone or anything else interesting to try out while I'm there?

Thanks,
Rob

I just inherited a KPC "Data Engine" TNC, complete with 1200 and 9600 modems. This unit will be placed into service as part of the East Atlanta LAN. Seems I've heard that there is an PROM build of JNOS that can be loaded into this TNC.

Anyone got any experience with this approach?

Thanks,
Steve Diggs

We had the same question. Dave's instructions were to "look at the byte offset 0x13d8 into that file".
We assumed he meant the byte location after the offset. You found a 2a after 18 same as we did.
Anyway, that is where we patched from 2a to 24 and things worked ok. If you find out otherwise, let
us know.

First, that would by copyright infringment. Second, I want people to
actually read the article in the magazine or as a reprint. There are
some nice examples and sidebars you would be missing if it were posted here.

Neither I nor anyone else can stop someone from doing this, but I
certainly won't.

Believe me. The series is worth reading in the magazine or in reprint form.
The responses I've already received have proven that point.

73,
Scott

The current most popular unit, at least by listening to the satellites, it the Yaesu FT736. Almost everyone seems to use it. The Kenwood has some human engineering and heat dissipation problems from what I hear, and the ICOM is too expensive. I have a 736 and like it a lot. Everything could be better, but it meets my needs well enough. Comes with 2/70 stock, modules for 6, 220, and 1.2 ghz are available. Mods for satellite data stuff are well published.

Probably your best bet.

YMMV

> use non-echoed passwords over packet?

I'm not sure what you mean by "non-echoing", since the host system wouldn't normally retransmit a password sent to it the first place by a user attempting to login. I think what you're after is an alternative to the conventional "send me your secret password" approach to user authentication.

Have a look at the "skey" utility, the source code for which you can find on "ftp://thumper.bellcore.com:/pub/nmh/skey". This utility implements the "one-time pad" approach to authentication and works something like this:

o Upon registration as a user of the host system, each user selects or is issued a "secret password string".

o Upon connection the host issues a "challenge string" consisting of a word and a number; the number decrements with each login until it reaches zero, at which time it's necesary to reinitialize that user's password info (thus requiring that passwords be changed from time to time, a fairly common practice in secure environments.)

o The user enters this challenge string along with his secret password string into a program running on his local computer; this program prints a string of five words as output, and these are then re-keyed (or cut and pasted if appropriate) to the remote host. If this response matches the one generated privately by the remote host, the user is assumed to be who he claims to be and is granted access.

Note that the "secret" component in this scenario is never transmitted over the air, but rather used as the seed to perform a transformation operation on *another* string. Since the challenge string is different each time a user logs in, recording previous logins is not useful. Finally, since DES encryption algorithms are used in the transformation, it would take an awful lot more computing power to crack this mechanism than your average AX.25 BBS traffic is worth. But then I editorialize.... ;-)

> is it legal?

Anyone who attempts to answer this question inevitably gets flamed by 50% of the readership, but since autumn is upon us and it's been getting a little bit chilly here lately....

IMHO this is absolutely legal. Part 97 forbids *encryption*, which it defines (this is from memory, so don't take me too literally) as encoding intended to "obscure the content" of a communication. In this application, the encryption (er, sorry -- encoding!) is not meant to *obscure* anything, since the content of the encoded string has no "meaning" to begin with. Rather, the purpose of authentication is to control access, which Part 97 (not to mention some recent legal precedents) allows.

>The problem is this: sending the STREAMSW
>character followed by a stream letter and nothing else temporarily
>locks up the serial flow from the TNC to the computer. I was able
[stuff omitted]
>If so you have the lock-up as well.
>Does anyone have the source for TNC2 firmware that can find this
>"feature"?

Congratulations Byon, you're the first to report this one! Unfortunately
1.1.9 is in beta test as we speak; I'd not put too much hope in seeing the
fix make it in the official 1.1.9.

****
WORK-AROUND:

An anamolous lockup condition will occur when the TNC is issued consecutive
streamswitches lacking one or more intervening SENDPAC (or other type-in
flow control-resetting) characters. This lockup can be worked-around by
setting FLOW to OFF.
****

Please let us know whether PaKet requires type-in flow control.

On your question, I'd very much like to hear from others who have source.

Opinion is that encryption for the sole purpose of authentication is
legal, since it is NOT a code or cipher intended to obscure the meaning
of the transmission, which is prohibited.

Kerberos authentication, S-Key, one-time pads, challenge/response, and
other secure mechanisms exist that could be used. No system which uses
a reusable authenticator (e.g., a password) is secure.

Personally, I like S-key for ham use.

Yes you are, there is a driver called AX25.COM wich could be used. Look for
the file AX1811.ARJ

There are also a driver wich could be used with BPQ. It's called BPQAX25.EXE
Look for BPQAX25.ARJ

So there's a lot of terminalprogs that could be used with baycommodem.

Nothing, it's just that Dave meant the SEQUENCE beginning at 13d8. Just change the 2a at 13d9 from 2a to 24. That's it! Works great! After heavy traffic, you'll see buffers going up again just like they're supposed to.

Note to others: the actual location is 14d8, but DEBUG in DOS adds 0100h so the location becomes 13d8 in DOS.

My reference was to the updated rules that were published last year.
In these newer rules, compensation is dealt with in 97.113(a)(2).
Part (b) says this:

97.113 Prohibited transmissions.

(b) An amateur station shall not engage in any form of
broadcasting, nor may an amateur station transmit one-way
communications except as specifically provided in these rules; nor
shall an amateur station engage in any activity related to program
production or newsgathering for broadcasting purposes, except that
communications directly related to the immediate safety of human life
or the protection of property may be provided by amateur stations to
broadcasters for dissemination to the public where no other means of
communication is reasonably available before or at the time of the
event.

>As to wasting resources, 99% of what we do as amateurs could be
>considered wasting resources by that standard. We're certainly
>not going to be able to save up spectrum for later use, once the
>moment is gone, it's gone whether we send anything or not.

True, perhaps, but my time is limited, and if I can't log onto the
local BBS because cookie recipes are being uploaded/downloaded, then I
see it as a waste of resources. I do favor stressing the system, so
that heavy-traffic incidents such as disaster relief can be prepared
for. I'd probably prefer a 10-line cookie recipe over a 200 line
Kep listing, but Keps are of direct interest to the general amateur
community, and as such are not illegal under part 97.

>The subject
>of content of speech is an area where the government should
>tread very carefully, if at all.

Again, this discussion is not about speech content, but one-way
communications.

: : >rule or something forbidding automatic passing of posts from other hams
: : >or something.

There ARE severe restrictions on 3rd party in Japan. In fact, two hams
that share the same radio cannot use each other's callsigns. On packet,
the ubiquitous FORSALE bulletins no longer exist there .... I believe
they were terminated in early 1992 due to an "advisory" from the MPT.

It would seem that the Japanese hams are a bit more conservative about
sending out bulletins addressed to WW - worldwide ...
: : >
: : >What is the real story in Japan? They don't have packet BBS's like
: : >those in USA there? Or have the Japanese hams not linked their networks
: : >to the rest of the world?

Well, 7J1YAA.10.JNET1.JPN.AS is operated by the Tokyo Int'l Ama. Radio Assn
made up of lots of Japanese and foreign (7J) hams.... they send receive
personal traffic worldwide. However, when I was living in Japan, we
would rarely see bulletins coming in from the USA ... supposedly it had
something to do with the vast amount of data and what it would take to
move all this traffic via HF links being way too burdensome.

: I thought that all telegraphy in Japan used the Katakana syllabary, not
: Roman letters, and certainly is in the Japanese language, not English.
: Please correct me if I am wrong. But if it is so, then the characters
: would appear as gibberish on our screens.

No .. "all" cw is not done in the Japanese katakana syllabary. JA CW
license/holders operators are required to learn int'l Morse first and
secondarily the Japanese Morse. You can tell when they switch in mid
QSO and/or when they call CQ that they want to use Japanese morse bcuz
you'll hear: -..---

Cheers
Sandy

-> Subject: using passwords over packet
-> Message-ID: <38he1p$iba@gboro.rowan.edu>
-> Date: 24 Oct 1994 22:55:53 GMT
->
-> i'm considering setting up a packet/internet gateway at my site, but
-> i'm concerned by the apparant lack of security. (i.e. if a user wants
-> to read his mail over the airwaves where anybody is listening, i
-> don't have a problem with that, but i don't want anybody who is
-> listening to then be able to log on as that user....) what i would
-> like to know is:
->
-> 1) is there a way to use non-echoed passwords over packet?
->
I've seen local FBB packet BBSes using a scheme whereby the BBS
gives you a list of 8 or so randomly chosen numbers from a list of
pairs of numbers; if you in turn supply the numbers that match these,
the BBS concludes that you are who your callsign says you are. Most
systems I've seen rely on the user's callsign.

-> and
->
-> 2) is it legal?
You'll have to ask a lawyer; in the US, there's a 5 foot shelf of
regulations for the Amateur Service. In Canada, yes, it would be legal
since our regulation only states "No amateur station shall use a secret
code." - authenticating a user ID isn't a code. Since the FCC has
discovered it can help reduce the budget problems by handing out massive
fines to amateurs without much hope of being effectively opposed, I can
see why you're concerned.

I'm beginning to think that only collecting QSL cards is legal on
amateur radio; as soon as you think of any application for ham radio,
someone will object its not legal.

Good, I'm glad you see our point then. The communication is two-way. I send a packet to the PBBS and it sends me an acknowledgement. What is one-way about that? The content may be construed as one-way, but the communication is definitely two-way. That is unless you set up your beacon text to be a 10 line cookie recipe. ;-)

And to whomever it was (was it you Dave?) that made the comments about folks being too cheap to purchase Internet access or whatever, that is really a stretch. That is like saying we should eliminate the phone bands because people are too cheap to make long distance calls.

The acks for the ax.25 protocol are little more than the op at W1AW looking at the power meter and seeing that watts are going into the antenna. The acks mean the data is reaching the other BBS. We don't know where the bits go from there. All we have in the ax.25 is a remote wattmeter.

Agreed, and I too appreciate the clarification of the rules prior to the
issuance of NALs. I'm probably risking flamage, but many of the messages
floating around packet BBSs don't have any relevance to amateur radio
whatever and are sent as bulletins (aka broadcasting). What I view as a
problem is the widespread abuse of the system. I see bulletins advertising
amateur equipment for sale. This, in itself, is not a problem. Yet a
large quantity of those messages are sent to ALLUS or, worse, WW. It's gotten
so bad that I don't even bother to read the messages.

>On the back of our license it says, in part, `Operation of the station
>shall be in accordance with Part 97 of the Commission's Rules.' Our
>signature on the front binds us to this statement.

Good words of wisdom, Jeff.

Playing Devil's advocate here, what's the difference between:

1. Getting on the repeater to announce I-65 is closed at the Brooks exit
because of an accident.
2. Talking to "Joe" on the repeater and telling him I-65 is closed at the
Brooks exit.

It can be argued that the first form is broadcasting and is therefore illegal
per Part 97 of the FCC Rules and Regulations.

For what it's worth, I think most of the packet bulletins are within the rules
and regulations. But there are a lot of messages that are questionable at
best. Quite frankly, I think many people should use common sense before
addressing a message (why send a message to 4SALE@ALLUS or 4SALE@WW when you
know darn well it'll be sold before it makes it across the country, for
example).

The KA9Q NOS varients already have this ability except that it truly does
segregate messages into different folders. Private messages to me are put in
my private mailbox while bulletins to FORSALE@anything are in the public
FORSALE mailbox. It really is a better way to handle messages, especially
since most people seem to want to view a small niche of messages. Hopefully
MSYS and F6FBB will add such capabilities in the near future. Frankly,
stuffing all messages in one pen is the pits.

>You have clearly missed the whole point of amateur radio in US being
>a self policing hobby. Would you like ham radio turn into the chaos
>of CB?

No one wants that, however you've misinterpred what self policing means. It does not mean vigilantes or self-important kilocycle cops. It means that each amateur is supposed to police *himself*, IE voluntary compliance with good operating practices. Admiral Grace Hopper said it best when she said, "it's better to beg forgiveness than to ask permission" in reference to dealing with government bureaucracies. Even the ARRL itself has often maintained that amateurs should not ask the Commission for rulings. They almost always prefer to say no since it exposes them to the least risk. It's better to wait and let them tell you that something you're doing doesn't suit them. They rarely do, and it gives us much more flexibility.

I'm not overly concerned about what an FCC staffer said about "bulletins" being one way transmissions. They obviously are not, and the FCC staffer likely isn't familiar with the corrupt terminology used by amateurs, so he didn't understand that the "bulletins" in question are actually third party traffic passed between amateur stations. This will eventually be straighened out when the right ear is reached. The FCC has already declared packet messaging systems to be handling *third party traffic*, so there can be no question that this traffic is broadcasting. What irritates me about this whole episode is that a Kilocycle Cop went to the FCC with his ill-conceived question and thus got an unfavorable ruling that will now have to be undone.

Well then lets look at what the FCC says about broadcasting. In
97.3 broadcasting is defined as, "Transmissions intended for reception
by the general public, either direct or relayed." Now it should be
clear that amateur packet messages are not intended for reception
by the general public. Only those who can log into the BBSs and
request the message be downloaded to them can read these messages,
and the general public can't do that. As 97.109(e) makes clear,
amateur BBSs are engaged in *third party* communications between
amateur stations. They are *not* engaged in one-way transmission
unless they are beaconing.

No, the acks say more than that. They are the packet equivalent of
QSL. They acknowledge that a transmission has been received *correctly*.
But BBS message passing consists of more than just AX25 acks. There
is a rigid BBS protocol for forwarding *third party traffic* between
these amateur stations. That has to be followed just as good traffic
handling protocols have to be followed on a CW traffic net in order
for the third party messages to be successfully handled. There are
no one-way transmissions involved, nor is there any broadcasting,
as defined in 97.3, involved.

The only thing that differentiates a cookie recipe from a Keplerian
element message or a "Best wishes from the World's Fair" message is
the *content* of the third party message. On that topic, the FCC
says only that the message content must not be commercial, and that
it must not contain the "seven deadly words".

Where?

There is a mention of AX.25 in the section about station control (97.109(d)), talking about re-transmitting signals unattended above 50 MHz, but I didn't see anything about "one-way communications." Did I miss that?

Wrong,

You can run programs such as JNOS using a packet driver such as AX25.COM, in a
similar way as you would with ethernet packet drivers,

I was using one until I purchased a Baycom ussc card.

|>
|> 1) is there a way to use non-echoed passwords over packet?

The user must somehow send the password over the air.
When he does, it can be heard.

If there were some way to send the password to the gateway without
anyone seeing it, any station which can provide a larger signal to
the gateway receiver could capture the connection, after the password
has been sent.

i.e. there is no way to be CERTAIN that any password system could work.

However, it is possible to provide "reasonable" security.
Check out the way that NET/ROM does it.

That said, I would ask two questions:

What is it you are trying to prevent?
Does that happen often?

Bob:

I can't speak for the other rigs, but I've been happy with my Yahoo FT-736R.
It of course does FM, SSB, and CW on 2m and 70cm, with options to add
up to any two of: 6m, 1.25m (220MHz), 23cm (1.2GHz).

I have added a 6m module to mine.

I've used it for 2m and 70cm 1200/2400 bps packet, too.

The rigs ability to separately tune, then lock together two bands
makes it great for satellite. It even works with inverting transverters
(one band tunes down, the other tunes up). Add a 70cm 100W amp and
a couple of antennas on an az/el mount, and you've got a great
satellite setup.

It's also handy that it has it's own built-in power supply, but you
can run it off 12VDC, too.

Only complaints about it: 1) you can't see both xmit and recv freqs at
the same time, and 2) the meter and freq display aren't very bright,
although works well enough under most conditions (I expect it's hard if
not impossible to read in bright sunlight).
Oh yeah, and it was a pain to modify for MARS, and could only open up
the 2m (140-149.995 now).

-> I just picked up a Kantronics KPC-9612 TNC and I own a
-> Kenwood 733A. The 733 has a 'DATA connector' with pinouts
-> that are stumping me. Here's what the book says,

-> 1. Should I believe that PR9 carries the data out of the 733 to the
-> TNC (packet data output) or is it just used as a signal indicating
-> that 9600 is present?

Yes. PR9 is the 9600 audio OUTPUT, which goes FROM the 733a TO the 9612.

-> 2. The KPC also has PINs marked for TXD and RXD,
-> transmit/receive(digital) Should I use these on the 733 instead of
-> the pins marked RXA and TXA?

Don't really know what TXD means on that TNC, but you can count on the
fact that what the 733a outputs is very broadband *audio*, so put it
into the 9600 audio input on the 9612.

-> The Kenwood directions are extremely limited in the area of packet
-> use and for someone who is relatively new in packet and HAM radio for
-> that matter I am somewhat dissappointed.

Roger that. The good news is that about the only bad way you can hook
the darn thing is to hook up the PTT line to ground. <g> That would keep
the XCVR transmitting carrier all the time. You're on the right track.
The first thing to test is...can you receive someone elses' beacon? If
so, proceed to connecting to someone else. Another pecularity about the
733a: an audio output of 500mv will swamp most implementations of the
G3RUH modem. That needs to be turned down by a factor of 10 to about
50mv. use a 10K cermet trimpot, with one end connected to PR9, the other
end to ground, and the middle to the 9612. Tune till you start getting
the beacon text. Or if you have it, use a 'scope to do the same thing.
At the same time, you can have the chance to see what a 9600 eye pattern
looks like.

We have several TM733a's operating with excellent results here in
Atlanta. We still can't get the MFJ1270+G3RUH to work with anything,
including the 733a.

3811. Is Anyone Responsible (Bad Language in Text)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-28 23:19:05 UTC
From: no8m@hamnet.wariat.org
Message-ID: <CyEoru.8py@hamnet.wariat.org>
Source record: 46754

A bulletin received at NO8M with lots of bad language has been
appended. I have two questions.

1. Who is responsible?

The originator and first forwarder are located outside the county and not
subject to FCC rules. F6FNB, located portable in Texas, is the first United
States station to receive the bulletin. He is neither the originator or first
forwarder. Trying to then interpret a rule to assign responsibility to him
when the meaning of "AUTHOR" and "FIRST FORWARDER" is plain is silly.
Hmmmm. No one has any responsibility?

2. Why wasn't it held?

This was held based on the bad words matching the MSYS hold file here. Is
there not a way with the software used by the other 22 DX and 13 US
stations who were involved to hold this at any of them? Do we have 35
BBS stations that can't set up a simple file to hold bad words or is this
impossible with them all? Lazy?

73,
Steve

Sorry about the language.

3812. KPC-9612 / Kenwood 733A Help?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-28 23:37:56 UTC
From: csetzer@rmii.com
Message-ID: <38s20k$sqk@potogold.rmii.com>
Source record: 46753

I just picked up a Kantronics KPC-9612 TNC and I own a
Kenwood 733A. The 733 has a 'DATA connector' with pinouts
that are stumping me. Here's what the book says,

733A
PIN NAME Function
1 PKD Packet data input: Transmit data from TNC to Transceiver
2 DE Ground for PKD
3 PKS Packet standby: TNC can use this pin to inhibit the
transceiver microphone input while
transmitting packet signals.
4 PR9 Detects 9600 bps data (500 mVp-p/10k-ohms)
5 PR1 Detects 1200 bps data (300 mVp-p/10k-ohms)
6 SQC Squelch control output

Here is what I'm thinking.

PIN 1 should go to the KPC PIN marked TXA - Transmit signal
PIN 2 should go to the KPC PIN marked GND - Ground
PIN 3 should go to the KPC PIN marked PTT - Push to talk
PIN 4 should go to the KPC PIN marked RXA - Receive signal

Others I leave alone. My questions are as follows:

1. Should I believe that PR9 carries the data out of the 733 to the
TNC (packet data output) or is it just used as a signal indicating that
9600 is present?

2. The KPC also has PINs marked for TXD and RXD,
transmit/receive(digital) Should I use these on the 733 instead of
the pins marked RXA and TXA?

The Kenwood directions are extremely limited in the area of packet use
and for someone who is relatively new in packet and HAM radio for that
matter I am somewhat dissappointed.

Thanks for the help in advance,

Craig

: 1. W1AW has NO CLUE that you are listening.
: 2. You BBS KNOWS you are connected, and that the two calls are in QSO.
:
: This really cannot be so difficult to understand?

Again, the acks for the ax.25 protocol are little more than the op at W1AW
looking at the power meter and seeing that watts are going into the antenna.
The acks mean the data is reaching the other BBS but we don't know where the
bits might go from there. All we have in ax.25 is a remote wattmeter.

What's to understand? It seems like people keep trying to assign intent
to the receiving station ... but intent for what? Why take a bulletin that
walks like a _bulletin_ and talks like a _bulletin_ and call it a "message"?

All bulletins are broadcasting. They are sent in many directions. When being
forwarded, the receiving station did not ask for them. The sending station
has no expectation that the receiving BBS will read or reply to them.

Steve,

I am afraid, some apologizing is called for here from my side.
When I received this junk on the cluster, it was a truely
silly thing in my fit of blind anger to repost it.

I have since than received lots of complaints for spreading
it.

It is particularly sad for the guys, whose calls have been pirated,
and hopefully they got the police/prosecuter to do something about it.

Yes, *now* I know, I was getting me in trouble.

73, anyway, Moritz DL5UH

3817. Re: using passwords over packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-29 21:29:18 UTC

Source record: 46760

> echoing of passwords over radio

The established procedure is that the password granting station
(i.e. the BBS) transmits an interrogation, with the user responding.
This could be a prompt like "1-2-3-4-5" meaning "out of a string of
XXX characters length that we both know, tell me character positions
1,2,3,4, and 5.

This is not really secure, since after a few weeks of monitoring, one could
reconstruct the (secret) string, but then:

*** packet radio is amateur radio.
*** amateur radio is open and avaailable to anyone.

Thus, anyone can read anyone else's mail if (s)he is just patient enough to
wait for the recipient to read it over the air. So, why password protect
users? The only place where it makes sense it to make it hard on people to
sabotage nodes and BBS.

73s,

>9600 is present?

The PR9 pin actually carries 9600 baud receive data - it's not just a signal to say data is present. In fact, it also carries 1200 baud data, voice, etc... whatever is being received!

The TXD and RXD pins on the KPC-9612 are DIGITAL outputs - intended for use at 19,200 baud with the Kantronics D4-10 high-speed radio. You should not use those with your Kenwood, Icom, Yaesu or other radios that do not take a direct TTL level input/output.

Well Rick, you can't operate two voice systems on a 15 kHz split either
if the sites are adjacent and signal strengths are similar. First adjacent
channel systems aren't co-located for this reason. The coordinating bodies
use geographical separation to make 15 kHz channels work, just like the
FCC does with broadcasters. The FM capture effect normally protects from
adjacent channel interference if the systems are geographically separated
far enough. 9.6kb packet systems are no different.

>It would be nice to have something that would work satellites,
>terrestrial packet, etc... (9600 baud and above) and be upgradable as
>things evolve. Don't want much, do I?

I've had all three, and wound up with the FT736R. The Icom 970 has
a nice user interface, but suffers a bit from excessive phase noise
in the receiver. That's a real pain if you are co-located with other
high power stations. The cost is also outrageous. The Kenwood 790A
is an abomination with regard to user interface and thermal design.
Mine got very hot after even modest transmissions, and failed from
thermal overload of the output module. The fact that you also have
to hold down the SAT button to do track tuning is also ridiculous.
And the narrow filter options *won't* work in the subband, that's
what you listen to while transmitting to the satellite on the
main band. Stupid! The 736R won't do simultaneous dual band receive,
but in all other respects it's the best value for satellite work. It
offers excellent thermal design, good control layout and functions,
and sufficient features. I haven't tried the new Icom dual band multi-
mode, it looks nice though.

> 2 DE Ground for PKD

Connect to TNC ground, pin 9 of the DB9.

> 3 PKS Packet standby: TNC can use this pin to inhibit the
> transceiver microphone input while
> transmitting packet signals.

Parallel this with the TNC PTT, pin 3 of DB9 wire ORed with pin 1 of
the DB15. That'll let you leave the mic on the radio without transmitting
room noise with your packets.

> 4 PR9 Detects 9600 bps data (500 mVp-p/10k-ohms)

Connect to TNC pin 2 of the DB15.

> 5 PR1 Detects 1200 bps data (300 mVp-p/10k-ohms)

Connect to TNC pin 5 of the DB9.

> 6 SQC Squelch control output

Connect this to pin 2 of the DB9 and pin 13 of the DB15.

And you need to connect pin 3 of the DB15 direct to the varactor
modulator inside the Kenwood for 9600 baud transmission. And of
course connect TNC PTTs, pin 3 of DB9 for 1200 baud and pin 1
of the DB15 for 9600 baud, to the radio PTT input.

>1. Should I believe that PR9 carries the data out of the 733 to the
>TNC (packet data output) or is it just used as a signal indicating that
>9600 is present?

It's the audio direct from the demodulator (no de-emphasis).

>2. The KPC also has PINs marked for TXD and RXD,
>transmit/receive(digital) Should I use these on the 733 instead of
>the pins marked RXA and TXA?

No. The Kenwood has no data slicers on board. These pins can be used with the Kantronics D410 radio which *does* have the capability to do direct FSK modulation and demodulation (up to 19.2kb) with TTL level digital signals.

>around for the units sold by Icom, Kenwood and Yaesu?

Bob,

Just as an alternative that wants to be considered for *serious* DX
work at VHF/UHF/SHF, what about a decent HF rig + transverters.

I think contesters, EMEers and likes prefer the comfort and strong
signal capability of this setup. (Just compare the amount of development
put into HF rigs lately to what is doing on the VHF/UHF/SHF multimode
market).

3831. How do repeaters work, or is csma/cd possible on packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-30 19:13:35 UTC
From: matt@plab.dmll.cornell.edu
Message-ID: <390r8v$mej@newsstand.cit.cornell.edu>
Source record: 46774

I'm currently trying to think through the design of an integrated modem+radio, and I've finally decided that I have to defer to the experts for advice. :)

Anyways, how is it possible for a repeater to receive on one particular channel and transmit on a nearby channel w/o blowing out the front end of the receiver? A brick wall filter seems ridiculous... but all of the design tips I've seen for radios says to save the filters for later, like after the first pre-amp or the IF stage. Won't the first pre-amp go up in a puff of smoke?

Likewise, does any body know how it would be possible to implement some sort of collision detection (or avoidance) on a single shared packet channel? On a cable that's easy, but over the radio the amplitude drops ensure that if you and somebody else transmit simultaneously, you'll only be able to hear your own signal (by and large). Of course, this assumes that the dilemma of the first paragraph is solved...

If you use amateur TCP/IP, the kernel AX.25 package allows a serial port to be attached with KISS the same way one might connect it for SLIP or PPP.

There are also various ports of NOS: WAMPES, JNOS, and I understand a port of TNOS is due sometime next month. These allow both TCP/IP and AX.25 L2 connects, although to BBSes instead of the shell. (I think you can configure WAMPES to allow shell connects; it runs an outside program for the BBS.)

AX.25 L2 really isn't suitable for your average character-mode *ix program. Line mode should work okay, but when even the shell expects character mode (bash and tcsh line editing) you're asking for trouble. And this ignores the problem of transmitting possibly illegal content over amateur radio.

When I post something (be it a mod file, or an image file, or short
program, or recipe, etc) to @WW or @USA or whatever, I anticipate that
someone out there would be interested in reading it. I do get replies
thanking me for image files (a teacher in France told me he's going to
use the "comet hitting Jupiter" images I posted in his class, which
might get some of his kids interested in ham radio maybe, another
set of replies when I posted an image of myself, all positive, no flames).

As Gary K____ (sorry, forgot your call) (the guy at a destructive test lab)
pointed out, the FCC considers all the packet posts as 3rd party traffic.
As long as you don't do something of "percunary(sp) interest" or use
dirty words, it's okay. Somewhat similar to hams on HF or 2meters
talking about the weather or health problems, in that the content is
not directly related to radios.

3838. Mild disappointment in latest Kam+ 7.1 firmware

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-30 22:26:13 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.783555973@BIX.com>
Source record: 46781

Just got the latest 7.1 upgrade for the firmware in my Kam+. Seems okay, but a little disappointing. First off, I bought my Kam+ only about 3 months ago, so a $40 upgrade (same as if I'd bought a year ago) seemed a little steep. Not really expensive, mind you, but just a little unappreciative of my business, I thought.

The manual that came is the same 7.0 manual that came originally with my Kam+. Another couple sheets gave the errata for version 7.1 which I ended up cutting up and Scotch taping into place, best I could. Again, given the manual's only 65 pages, I kind of felt like they could have planned this well enough to give me a current manual without the need for the errata sheet.

The big reason to buy the upgrade was the new TOR mode which is touted as able to recognize AMTOR, PACTOR and GTOR modes automatically. This sounded great. I really hate tuning across the band, finding a signal, but then having to experiment to see what mode they're using. Seems like an excellent problem for software.

The big disappointment is that the TOR mode ONLY works when someone tries to LINK to you, e.g., following your CQ. What a half-!#@ implementation! Okay, yes, I'm glad to have at least that, but why in the world did they stop there? It makes no sense.

On the whole, I continue to feel generally satisfied with my Kam+ and with Kantronics -- if I had it to do over again, I'd buy the same unit -- but, as I said, I thought this upgrade was a bit disappointing.

>market).

Alas, aside from the SSB Electronics units imported from Germany,
which cost more than a good HF rig here, there aren't any suitable
transverters on the US market. The available transverters *crunch*
long before the signal gets to the HF rig, so their use is counter-
productive. Of course you could build your own, but consider that
a Tech licensee would have no other reason to buy a HF rig, so
you're spending twice the money for the same capability that's
offered by the multi-mode VHF/UHF rig. Any extra money is better
spent modifying the multi-mode to be more *crunch* proof. Example:
the old Mutek front end kits for the IC2xx series were dynamite
at solving sensitivity and overload problems with those rigs,
and it was a relatively cheap fix.

>a little about KA9Q and its derivatives. Would this be what I need?

It could be *exactly* like getty, in fact you can use getty. Just
treat the TNC as a modem and wire up the DCD line. The TNC asserts
that when a connection occurs, and will signal getty to spawn a
login process, just as a telco modem would. So after you connect
to the TNC, you'll see a login: prompt sent back to you. Then
proceed as normal for a telco login.

Of course since you're on an open radio channel, don't login
to any account you want to keep secure since everyone monitoring
will see the password. Setup a radio login that you wouldn't
mind *anyone* using, and set permissions accordingly. Visual
applications won't run worth spit over the slow half duplex
link, so you'll need to run vi in ex mode, and forget about
doing anything with X.

If you need client/server functionality, then you'll want
to use the kernel AX25 driver and TCP/IP with a KISS TNC.
That's a much higher level of complexity to set up, but gives
you more flexibility.

Gary

|>
|> Personally, I like S-key for ham use.
|> - Brian

As the original author of S/KEY (back when I was at Bellcore), I can say that my whole original motive for creating it was to allow me to log into my UNIX box at home over 2m packet without revealing my password. So yes, as far as I'm concerned it's perfectly legal over ham radio.

Phil

yes.

|> If there were some way to send the password to the gateway without
|> anyone seeing it, any station which can provide a larger signal to
|> the gateway receiver could capture the connection, after the password
|> has been sent.

yes. This is called an "active attack" in the networking world. As opposed to a "passive" attack involving simple monitoring of another's transmissions and possible later use of stolen passwords.

|> i.e. there is no way to be CERTAIN that any password system could work.

Not true. Yes, S/KEY (which I wrote at Bellcore) is secure only against passive monitoring attacks. But there are other schemes that would provide very high degrees of security while still being legal under the amateur rules.

Consider a protocol that authenticates each and every packet with a secret key known only to sender and receiver. You can form the authenticator with an MD5 hash over the packet and secret key. The recipient generates his own hash locally and compares it to the one that was received. If they match, he knows that the packet was actually sent by the other party and that it has not been spoofed or modified in transit.

Of course, it could be a "replay" of a recording made of an old legitimate packet. Various methods can be used to decrease this vulnerability, such as time stamping and the use of transport protocols already resistant to packet duplication, such as TCP.

The shared secret key used to "sign" each packet could either be agreed on in advance using a secure channel (such as a face-to-face meeting) or it could be generated using various public key techniques. One good algorithm is Diffie-Hellman key exchange, followed by an RSA signature to guard against the "man in the middle" attack on Diffie Hellman. True, you could just use RSA to sign every packet directly, but RSA is too slow to be practical for this purpose. Except maybe at 1200 baud. :-)

A protocol to do all this is currently under development in the IETF IP Security Working Group (IPSEC). Although this protocol is capable of encrypting the contents of every packet, I am being careful to ensure that

it provides an authentication-only mode that would make it legal to use over amateur packet radio.

Phil

3846. Re: How do repeaters work, or is csma/cd possible on packet?

>Anyways, how is it possible for a repeater to receive on one
>particular channel and transmit on a nearby channel w/o blowing out
>the front end of the receiver? A brick wall filter seems
>ridiculous... but all of the design tips I've seen for radios says to
>save the filters for later, like after the first pre-amp or the IF
>stage. Won't the first pre-amp go up in a puff of smoke?

Sure would. That's why repeaters use cavity filters called *duplexers*
in *front* of the receiver and transmitter. The duplexer consists of
pass and reject cavities tuned and combined so that only signals coming
from the antenna on the receive frequency get to the receiver, and so
signals on the transmit frequency only get passed to the antenna. The
transmit signals are blocked by the cavities from reaching the receiver.
A good duplexer can give 100db of isolation between the transmitter and
the receiver, assuming proper channel splits. Typical splits are 600 kHz
on 2 meters, and 5 MHz on 70cm. Those 2 meter cavities are *big*. They
have to be to keep the Q high and the insertion loss low.

Here's a drawing of a simple 4 cavity pass/reject duplexer:

RCVR----R pass---T rej----ANT----R rej---T pass---XMTR

Other combinations of pass/reject cavities, and more than 4 cavities,
are common. A plain notch duplexer with three reject cavities in
each path, and no pass cavities, is common, but the pass cavities add
rejection of other RF crud on the site and are useful. The cabling
is part of the system and the cavities must be tuned with the cabling
in place and the ports terminated in their expected impedances.

>Likewise, does any body know how it would be possible to implement
>some sort of collision detection (or avoidance) on a single shared
>packet channel? On a cable that's easy, but over the radio the
>amplitude drops ensure that if you and somebody else transmit
>simultaneously, you'll only be able to hear your own signal (by and
>large). Of course, this assumes that the dilemma of the first
>paragraph is solved...

On a simplex channel, collision detection is impossible. On a
repeated duplex channel, CD is possible. The secret is that
everyone listens to the repeater output all the time. If you

don't hear your own packet coming through unmolested, you know
that a collision is taking place. Collision avoidance can be
implemented statistically, and is, in TNCs by use of p-persistance
backoff algorithms. It doesn't work right unless *everyone* on
the channel sets their parameters properly, and hidden terminals
still plague the system on non-repeated channels.

The K9NG and G3RUH articles in ARRL Computer Networking Conference Proceedings several years ago described these two designs in detail. I believe some of these are no longer available from ARRL, but TAPR is reprinting them. Contact tapr@tapr.org for information.

Sorry I can't do a proper quoted reply with this mailer yet but:

dbushong@wang.com (Dave Bushong) writes:
>Again, this discussion is note about speech content, but one-way
>communications.

As Gary Coffman already pointed out, bulletins are not one-way. The confusion comes from confounding the "To:" line of the message with the actual communication. To upload (or download) a bulletin, the ham first has to connect to the BBS in question. From then on, anything passing between nodes is two-way communication. It doesn't matter that the intent of the writer is to send what's written to an undefined group of people -- the communication is two-way from the writer's node to the BBS. In a like manner, the people who read it are reading it after establishing two-way communication with their BBS. No problem.

On the question of OO's as general band cops, that's not in their charter. They have no enforcement powers. An OO card is "a friendly advisory" because we all make mistakes. OO's are specifically instructed to avoid gray areas and to avoid over-intellectualizing the rules. Obviously the one in question messed up, but we all make mistakes.

I am looking for information about licensing requirements in Uzbekistan.

I need answers to the following questions:

Is there a reciprocal licensing agreement between the U.S. and Uzbekistan?

Who would I contact for this information?

How would I go about applying for a license there?

Any information on this would be greatly appreciated.

Thanks, Larry, N2AYW.

David Dodell (david@stat.com) wrote:
: I seem to be experiencing RF getting into my KAMPlus ... anyone else
: notice a problem with this?

I had some RFI problems. I put the Radio Shack 'snap together'
ferrite cores on the 12V input and on the plug going to the radio.
Plus I grounded the KAM by putting a ground wire (coax braid) on
one of the RS-232 connector screws. That seemed to solve it. Of
course, I don't know if it will show up again on another band.

3858. PK232 19200 Mod?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-31 16:11:00 UTC
From: steve.diggs@totrbbs.atl.ga.us
Message-ID: <2923.18.uupcb@totrbbs.atl.ga.us>
Source record: 46805

I own a PK232 that is doing a fine job for me...I added a TAPR 9600 modem to it, and all is fine down South...

With the data coming in at 9600 bps, and 9600 is also the DTE rate from the TNC to my PC...data flow to the screen leaves something to be desired.

Has anyone done the 19200 DTE mod to the PK232? I called AEA, and they say that they don't do it, but they have heard of it being done. Something about changing a crystal out...

I would appreciate any feedback; if I get a mod, I will post it on my BBS and make it available for all.

I tryed that but I have the system lock up. Reason for that was that I
was that I run a program PACICO that get headers off of the bbs and puts
them in the newsgroup rec.radio.amateur.edmonton.alledm (USENET).
Be careful that you are just using the tnc or the tty for 1 operation
would be my suggestion :)

Perhaps the same way we always have. e.g. information about
cookies might be sent as COOKIE@USA ...

Gee, we've been doing this for years (zt least 10).

Should not be so difficult.

If your local BBS system does not support operations that allow
you to view the category of your choice, perhaps it should run
different software.

|> Hmmmm. No one has any responsibility?

Seems to me that "author" is clear - it's the person who wrote it.
However, "first forwarder" probably means "first US licensee forwarding."

Note also that the prohibition against "bad language" still exists
for EVERY station that transmitted this stuff ... including NET/ROM
nodes, full duplex repeaters, whatever. The FCC is probably not real
interested though.

There is no requirement to "hold and read" so many sysops choose not to.

Note that this is perhaps the third or fourth "bad message" to make
it into the network THIS YEAR. I've handled approx. 125,000 messages
so far this year. The system works, there are VERY FEW bad msgs.

<all that bad language deleted>

Well Steve, guess YOU are responsible for polluting the network
here on the internet with that bad language.

There have been several bulletins with "unacceptable language"
recently. All appear to have originated in Europe.

Since the general origin of these are known, perhaps the gateway
station importing them into this country might just stop doing it.
i.e. shut down the ilnk with the system that is forwarding this junk.

3864. Re: NoCal OO goes after Packet BULLetins

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-31 18:55:34 UTC
From: little@iamu.chi.dec.com
Message-ID: <393ej6$ia1@nntpd.lkg.dec.com>
Source record: 46803
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.digital.misc

Please forgive the length of this post, but there are some that would try and have us believe that their narrow view of amateur radio and the FCC regulations is anything other than their own personal fantasy.

Lets make this as simple as possible. From Webster's Ninth New Collegiate Dictionary:

Communication - An act or instance of transmitting.

Transmit - to send or convey from one person or place to another.

From Part 97.3 (a):

(10) Broadcasting - Transmissions intended for reception by the general public, either direct or relayed.

(28) Message forwarding system - A group of amateur stations participating in a voluntary, cooperative, interactive arrangement where communications are sent from the control operator of an originating station to the control operator of one or more destination stations by one or more forwarding stations.

(43) Third party communications - A message from the control operator (first party) of an amateur station to another amateur station control operator (second party) on behalf of another person (third party).

97.111 Authorized transmissions

(a) An amateur station may transmit the following types of two-way communications:

(1) Transmissions necessary to exchange messages with other stations in the amateur service, except those in any country whose administration has given notice that it objects to such communications. The FCC will issue public notices of current arrangements for international communications;

Also, from Part 97, the only reference to limitation of content of transmissions are as follows:

97.113 Prohibited transmissions

(a) No amateur station shall transmit:

(3) Communications in which the station licensee or control operator has a pecuniary interest, including communications on behalf of an employer. Amateur operators may, however, notify other amateur operators of the availability for sale or trade of apparatus

normally used in an amateur station, provided that such activity is not conducted on a regular basis;

(4) Music using a phone emission except as specifically provided elsewhere in this section; communications intended to facilitate a criminal act; messages in codes or ciphers intended to obscure the meaning thereof, except as otherwise provided herein; obscene or indecent words or language; or false or deceptive messages, signals or identification;

(5) Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services.

(b) An amateur station shall not engage in any form of broadcasting, nor may an amateur station transmit one-way communications except as specifically provided in these rules; nor shall an amateur station engage in any activity related to program production or news gathering for broadcasting purposes, except that communications directly related to the immediate safety of human life or the protection of property may be provided by amateur stations to broadcasters for dissemination to the public where no other means of communication is reasonably available before or at the time of the event.

(e) No station shall retransmit programs or signals emanating from any type of radio station other than an amateur station, except propagation and weather forecast information intended for use by the general public and originated from United States Government stations and communications, including incidental music, originating on United States Government frequencies between a space shuttle and its associated Earth stations. Prior approval for shuttle retransmissions must be obtained from the National Aeronautics and Space Administration. Such retransmissions must be for the exclusive use of amateur operators. Propagation, weather forecasts and shuttle retransmissions may not be conducted on a regular basis, but only occasionally, as an incident of normal amateur radio communications.

And finally:

97.219 Message forwarding system.

(a) Any amateur station may participate in a message forwarding system, subject to the privileges of the class of operator license held.

(b) For stations participating in a message forwarding system, the control operator of the station originating a message is primarity accountable for any violation of the rules in this Part contained in the message.

(c) Except as noted in paragraph (d) of this section, for stations participating in a message forwarding system, the control operators of forwarding stations that retransmit inadvertently communications that violate the rules in this Part are not accountable

for the violative communications. They are, however, responsible for discontinuing such communications once they become aware of their presence.

(d) For stations participating in a message forwarding system, the control operator of the first forwarding station must:

(1) Authenticate the identity of the station from which it accepts communications on behalf of the system; or

(2) Accept accountability for any violation of the rules in this Part contained in messages it retransmits to the system.

The above definitions are relatively simple to understand. I presume that if you hold and amateur radio license you can understand the above definitions and regulations.

Now, let's look at how packet radio works. I connect to a packet bulletin board system (PBBS) by transmitting a connect request packet. The PBBS transmits a connect acknowledgement indicating that it can and will communicate with me. I have thus met the requirements for two-way communication. I have also met the requirements for station identification as each transmission contains the transmitting stations call sign. At this point, what I send as long as it isn't music, obcene, or any of the other content prohibitions specified in Pary 97.113(a)(4) is completely legal. It is two way communication as the two stations involved in the communication are clearly sending and receiving information. It is not broadcasting as the general public isn't in a position to receive my transmissions.

Let's take the message I just composed to RECIPE (which you'll note is part of the content of the message, not an identification of the sending or receiving station) and follow it along its path. The PBBS system I just left the message with will now look at its forwarding tables and decide what other PBBSs to send the message to. It decides to forward the message to PBBS 2. So it transmits a connect packet to PBBS 2 which in turn transmits a connect acknowledgement. The two PBBSs now exchange packets and forwards my message to PBBS 2. Again, the communication is two-way and the sending and receiving stations identified.

So where is the "illegal" part of this communication? This is no different from me telling someone that they should tell anyone they talk to that is interested to try my cookie recipe. Each time they tell someone to try the cookie recipe, it is a two-way communication as authorized and allowed by Part 97. That amateurs I've never heard of will receive the recipe is completely and totally irrelevant as Part 97 doesn't prohibit the forwarding of messages. In fact, it specifically allows the participation of amateurs in message forwarding systems where the messages may be sent to one or more destination stations (please see Part 97.3(a)(28) above.)

Also please note that nowhere in the description of a message forwarding system does the mode of communication enter the regulations! The FCC

clearly intended amateurs to be able to send messages to one or more stations by the exact means currently used by PBBS users today.

3867. NOS running at Southern Illinois University

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-31 21:16:00 UTC
From: jjacobse@siucvmb.siu.edu
Message-ID: <jjacobse.4.001544E8@siucvmb.siu.edu>
Source record: 46815

Well, our club (W9UIH) is finally on the Internet at Southern Illinois University.Despite all of the problems, if you are curious, please telnet to 131.230.197.32 if you are interested in access. You must, of course, be a current radio amateur.

Other than that, I am sending a request to many NOS sysops who are also on the internet to create a AXIP netrom gateway. If you are interested in this, please leave me a message at the address below, or log into the above system and send a message to 'sysop'.

We are trying to create a rather large system here in Carbondale, Il due to the fact that mail forwarding is basically absent and the nearest wormhole is 90 miles. Please help us set up a monster system to give the Carbondale amateur radio society the quality and reliability that only major cities have.

Thank you,
Jim Jacobsen (N9IEO)
President, Southern Illinois University Amateur Radio Club (W9UIH)

3868. Help with PK232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-10-31 21:27:08 UTC
From: dgriswol@sun.cis.smu.edu
Message-ID: <1994Oct31.212708.5699@seas.smu.edu>
Source record: 46812

Hello, all.

I am having trouble getting the PK232 I am borrowing to key my transmitter when I give it a Connect command. Now, the odd thing is that I _can_ key the transmitter when I am in Calibrate mode. This tells me that it is not a matter of a shorted wire, because the radio will transmit, but not in the normal mode. I have a Yaesu FT2400H (2 meter), and the computer I am using is a PC-XT, or some such ancient device. I can monitor packet activity just fine, but I am out of luck when it comes to transmitting. The parameters (such those that allow one to transmit) seem to be set properly. What am I missing?

I would be grateful for any help offered.

Glad to hear other folks beginning to use this excellent radio for packet use. I have a GEMII of the 70cm variety that I am modifying for 9K6 packet repeater use, and have been working on the mod. since acquiring the unit at Dayton this year.

First thing to keep in mind: the MII comes in MANY different manufacturing versions, and it is quite easy to inadvertantly pick up the WRONG docs for the exact unit you have. There will be a paper tag on each PCB assembly section; go by THAT number to match docs. Disregard any other info! Next, a simple question: in the control head area up front of the radio, you will find a bank of pins labelled P904. Is one of those pins marked "DISC" ??

On the receive side, my interface worked the first try. The DISC pin noted above comes right off the IF. To improve bandpass characteristics of the IF receive audio, the final RC filter may have to be removed, but anyway, I was able to copy beacon text without ANY modification.

On the transmit side, the general approach is to use the temp. compensation curcuit in the ICOMs as a way to impose 9k6 modulation on the transmit signal. Only problem is that there is a 5 volt bias on that line, and I'm just now getting around to constructing an OP AMP curcuit to take the 9k6 audio and add the proper DC bias. A high performance OP AMP is needed to not distort the 9k6 audio; I'm using the NSC LMC-6082.

Anyway, maybe between us we can come up with a "cookie cutter" MOD file for this excellent radio.

Have you considered JNOS? It will uuencode binaries automatically for download as well as support ftp. It also has node capabilities. Since it is available as source code, a compile only need include as much as you want or need.

Source record: 46808

thanks for reading. We are running a file server here on packet,
(not a full-service bbs; just fs and local message base) and I'm
looking for better software. We're currently using PaKet, and
it
's designed as User software, with a tacked-on Remote Mode, which
is the only part we're using. we need passworded remote access
to the system for sysop(s), and something a little less glitchy
would be nice as well.
If necessary, I suppose we'll have to use full-service bbs
software of some sort, like fbb or msys, although something
designed with local message base/file servers in mind would be
mo bettah. I have downed copies of incomplete distribution
packages with broken files that wouldn't unzip, form cfcsc.dnd.
ca, and would really appreciate hearing of an ftp site with
complete files which will unzip and work of fbb and msys. Also
suggestions for other software options would be much appreciated.
Ditto for node software - we may want this thing to be a node
as well some day. Thanks.

I've been thinking about this kind of thing a bit, and I've come
up with what seems like a very secure solution, but I don't know how
practical it would be.

Basically, the system would hinge on using PGP, or some other
application of RSAREF. The public key component would be kept on the BBS,
and the private part on the user's machine. When the user logs in, the
software could require him to sign a piece of text (perhaps the date/time
or some other thing which would change often).

The problem with this approach, of course, is its implementation.
The RSAREF source is covered under a very broad license in the US, and
could probably be implemented in a special-purpose term program without a
terrible amount of difficulty, but it wouldn't be compatible with existing
software.

ftp to ftp.ucsd.edu and get the ethrax25.zip file. This will allow
you to talk to a KISS tnc and run TCP/IP applications over the air,
including Windows Sockets applications if this is what you're trying to do.

As for actually putting AX.25 in a Windows Sockets package, I don't know
of any at the moment.

There are several Internet-to-packet gateways running. Generally, you need to have the sysop set up permissions for you to be able to access the radio side, however (to keep the FCC happy). There is a list of gateways on a server in Australia called "minnie", but I can't seem to locate the full address in my pile of papers here.

Source record: 46825

Hi - this is a question from the not so cold north (so far :-))
where secret codes are prohibited but that may not preclude the transfer of
binary data on HF.

I was wondering if anyone has come across a terminal program which permits
the transfer of binary data or 8 bit data via pactor. Raw data sends are
possible with DSP/PK Gold for example - but I have yet to come across any
TNC program that would enable one to use the full capabilities of this mode.

Suggestions etc are most welcome since we are interested in exploring some
of these capabilities of Pactor.

Thanks in advance.....

Look at the source code to NOS (also referred to as KA9Q). Although
it is mostly for doing TCP/IP, it also supports AX.25 connections
(as well as NET/ROM and other goodies).

Just to clarify, you can use NOS to do AX.25 and source code is available.

3891. Uzbekistan licensing requirements?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-01 14:55:04 UTC
From: bc21470@bingsuns.cc.binghamton.edu
Message-ID: <395ks8$cn3@bingnet1.cc.binghamton.edu>
Source record: 46830

I am looking for information about licensing requirements in Uzbekistan.

I need answers to the following questions:

Is there a reciprocal licensing agreement between the U.S. and Uzbekistan?

Who would I contact for this information?

How would I go about applying for a license there?

Any information on this would be greatly appreciated.

Thanks, Larry, N2AYW.

3892. Compatible radios with KPC9612

3893. FTP'ing HeathKit HK-21EPROM's f

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-01 16:46:21 UTC
From: transcon@ozspace.brisnet.org.au
Message-ID: <1994Nov1.164621.2583@nntp.brisnet.org.au>
Source record: 46833

Hi! Can anybody help me out with where I might be able to FTP an update
EPROM image for my four HeathKit HK-21's that I own? I really need the
Kiss protocol etc that they don't currently have!
I am trying to set up a BBS using AmiTCP/IP and the only driver's require
Kiss!
Boy am I in diare-straight's!

The Modem's fire up with the following.

TR SERVICES TR-21
Release 1.04 08/22/88 - 32K RAM
Checksum $00
cmd:

Although they are branded TR-Services, this is just the Australian name, the
modem's are definatly identical to the Heath Kit HK-21's. THe doc's even refer
to that model with pictures etc!

Can anyone recomend any site's to FTP this sort of stuff from?

So what you are saying is that when I call 7P1AAA on CW, hoping to work
a new country, all I have to do is watch my wattmeter and verify that
I responded to his CQ, and I have a valid QSO?

What point are you attempting to make?

The ACK does not come from W1AW, it comes from the station W1AW
is in QSO with, includes W1AW's callsign plus the callsign of the
station W1AW is in QSO with. The ACK contains TWO callsigns.

Gary Coffman has hit it on the head. Let me add my $.02:

The intent of the packet message is not one way but is to solicit
a reply, just like a CQ, except that it is not real-time. Any packet
message not intended to solicit a reply, and that does not relate
solely to ham use is a broadcast and is not permitted.

For example a notice about the NY Cookie Eaters Assoc. meeting in
Mrs Fields restaurant on 6th Avenue is a broadcast and is NG since
it is not solely for ham use.

Notice about the Cookie Eaters Net on 40m is for ham use and is OK,
in my humble opinion. Also notice of the XYZ Amateur Radio Club
meeting in a restaurant on 6th avenue is also OK. This is similar
to W1AW one-way xmissions.

A message asking if there are any cookie nets on 40m or asking when
the next NY Cookie Eaters Assoc. meetings is is also ok since it
is soliciting a reply. This is like the start of any net, or a CQ,
or the "Are there any base stations to handle emergency traffic" call:
a one-way xmission soliciting a reply.

BTW: I too like cookies :-)

|> transmissions and possible later use of stolen passwords.

In fact, this technique was used in approx. 1987 to regain control of
a "rogue" NET/ROM node in California. Waited until the person who knew
the password had logged into the node, then provided a much larger
signal with the correct callsigns, protocol details, etc. and shut the
node down. Was not actually that hard to accomplish.

|>
|> |> i.e. there is no way to be CERTAIN that any password system could work.

|> actually sent by the other party and that it has not been spoofed
|> or modified in transit.

And in fact Phil is exactly right here. Each packet must carry
it's own authentication to gaurantee security. This could be
accomplished in a higher layer of the protocol, perhaps, and thus
might be run over NET/ROM. Just a thought ...

|> Of course, it could be a "replay" of a recording made of an old
|> legitimate packet. Various methods can be used to decrease this

|> vulnerability, such as time stamping and the use of transport
|> protocols already resistant to packet duplication, such as TCP.

Another good point.

|> over amateur packet radio.

This is interesting work.
I wonder if we would need changes to the rules to use this protocol?
If the intent is not to "obscure content", then we probably do not
need rule changes, but if the intent IS to "obscure content", we might.

Anyone have some insight into this issue?

Be sure of that the threshold adjustment on the front of the TNC is
set too high, if the DCD is active the TNC will not transmit. Also
make sure that the squelch is set properly. The PK232 will not transmit
if the radio is opened squelched unless it has been modified.

No. ACARS is MSK, which cannot be handled by a non-MSK modem. Are there "expensive decoders" available for ACARS? I'd be wary, since the airlines can transmit basically anything they want in an ACARS packet, so they can do any kind of shorthand or code they please. You may demodulate it, but you may not be able to read it.

3903. 9600bd radio's ?? NOT !

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-01 20:46:19 UTC
From: joopv@etprs.phys.tue.nl
Message-ID: <joopv.783722779@etprs.phys.tue.nl>
Source record: 46693

Since some time now several manufacterers of ham radio equipment offer
'9600 bd ready' vhf/uhf transceivers. I got one of these for some tests,
and was very surprised with the results. This is a brandnew mobile uhf rig,
FM only, from one of the 'big three' brands. The price is in the $500-$600
range.

Turnaround time : TX to RX is 120 ms. RX to TX is 140 ms

Transmitter frequency charasteristics : (reference = 3kHz deviation at 1kHz)

160 Hz - 7400 Hz straight whitin 2 dB. (160 Hz : +1 dB, 7400 Hz : -1 dB)
When the freq. drops we see this peak :
95 Hz : +3 dB (4.2 kHz deviation)
59 Hz : +6 dB (6 khz deviation)
41 Hz : +8.5 dB (7.7 kHz deviation)
30 Hz : +6 dB (6 kHz deviation)
25 Hz : +3 dB
22 Hz : 0 dB
20 Hz : -3 dB

I also measured group delay time from the transmitter :
30Hz : -11 ms, 35Hz : -7.5 ms, 41Hz : -4 ms, 45Hz : -3 ms, 45Hz : -3 ms,
50Hz : -2 ms, 60Hz : -1 ms, 70Hz : -480 us, 80Hz : -230 us, 90Hz : -100 us,
110 Hz : 0 us, 150 Hz : 50 us, 500 Hz : 50 us, ... 7000Hz : 47 us.

I also did the same measurements on the receiver. There the frequency response
was totally flat from 12 Hz to 5 kHz. -6db points at 10 Hz and 7 kHz.
Group delay was at a constant 150 us over the complete 20 Hz to 7 kHz range.

The next thing was of course to do some packet tests with 9600bd modems.
I did it by transmitting and receiving >10000 full-length packets
of 256 bytes.

The result was astounding, but understandable when you look at the above
measurements : receiving was ok, about 98 % of all packets were decoded ok.
But the transmitter produced only 55 % readable packets !!

This is clearly a PLL-transceiver which is modulated at the VCO from the PLL.

How can it be that this rig is being sold as '9600bd ready' ? Do they have
different 9600bd modems in Japan? The G3RUH / K9NG modem system needs a flat
frequency response from 20 Hz to 6 kHz.

And what about those turnaround times ? 120 ms is IMHO totally unusable
for 9600bd packet. This thing sure is going to produce lots of collisions
on busy channels !

Or am i setting my standards too high ? For somebody who only receives large packets and transmits small packets (the average mailbox user ?) the rig may *seem* to work ok. (at a given bit error rate, the chance of producing a garbled packet is of course smaller for small packets)

I am wondering if anybody did the same tests on so-called '9600bd ready' transceivers. Especially the FM rigs, the allmode rigs should be ok because they have a separate FM modulator, and don't use the PLL for modulation.

In fact, i tested an allmode rig from the same manufacterer and found it to be excellent, turnaround times of less then 25 ms, and flat frequency responses. And thus also very low bit-error rates, 97 % or better according to the above-mentioned tests.

Joop, PE1DNA.

3904. 9600bd radio's ?? NOT !

Hi Joop,
The East Atlanta LAN, a packet experimenters group here in Atlanta, has begun operations with our first general purpose 9600 digi. While we haven't done a good statistically based RF performance test of various transcievers yet, our experience with the "9600 ready" rigs has been good - when used with a TNC that has a sound G3RUH implementation to start out with. The two factors are inexorably tied; bad modem/radio matchup; poor performance. The Paccom Sprint2 is an excellent performer in terms of low distortion in the transmitted eye to the xcvr; so is the PK232/TAPR 9600, KPC9612, and KPC Data engine. The MFJ1270 + their G3RUH implementation is just terrible. I maintain that one of the sound TNC performers noted here with a "big three" 9600 ready xcvr. will produce better-than-acceptable performance on-air.

-> And what about those turnaround times ? 120 ms is IMHO totally
-> unusable for 9600bd packet. This thing sure is going to produce lots
-> of collisions on busy channels !

Boy, are we really operating in the blind! We operate with TXD set to 22 and it performs beautifully! Based on what you say here, I'm going to cut it down to 13-15 and see how it does!

-> I am wondering if anybody did the same tests on so-called '9600bd
-> ready' transceivers. Especially the FM rigs, the allmode rigs should
-> be ok because they have a separate FM modulator, and don't use the
-> PLL for modulation.

Our experienc has born this out. I have a Kenwood TS811 which has been modified for 9600, and we kind of use it as the standard to measure other radios against. I have been trying to get the cheaper PLL modulated rigs to work for a year and a half - with disappointing results. About 3 months ago, James Miller suggested a new approach to me: try a "two point modulation" approach, wherein both the VCO AND the master reference oscillator are modulated with the 9600 audio. In this manner, the cancellation effect of the PLL is eliminated. I have even found a company, MX*COM, which makes a chipset to facilitate this approach. I haven't had time to try it, but it's on this winter's list of projects. If such an approach were to work, it would open 9600 packet

to MANY, MANY hams who own run-of-the-mill FM only rigs. Any ideas here?

I look forward to your feedback, hoping that we can open this field up a lot of creative work!

Regards,
Steve Diggs, President
East Atlanta LAN

The problem with FSK modulating a PLL FM rig is probably generic to all such radios. The PLL's job is to track out frequency error, and unfortunately that also causes it to track out the low frequency components of the data.

Perhaps it's time to talk about schemes to shape the baseband data spectrum. The best known example is Manchester encoding, which unlike NRZ has no DC component. But Manchester contains much higher frequency components than NRZ, which is bad.

Fortunately there are alternatives. The Compact Disc uses something they called "8 to 14 modulation" which was designed to get rid of the low frequency (< 20 Khz) components that would upset the pickup tracking servo without raising the high end of the spectrum too much.

The approach they used is pretty general. Just build a code table using words that give you the spectrum you want when you feed in random data. The early papers on the CD talk about how this was done. Perhaps we could do something like this to design a new coding scheme for direct FSK radios.

Hi

>1. Who is responsible?

>The originator and first forwarder are located outside the county and not
>subject to FCC rules. F6FNB, located portable in Texas, is the first United
>States station to receive the bulletin. He is neither the originator or first
>forwarder. Trying to then interpret a rule to assign responsibility to him
>when the meaning of "AUTHOR" and "FIRST FORWARDER" is plain is silly.
>Hmmmm. No one has any responsibility?

I am W5/F6CNB (not F6FNB) and i run a forwarding only BBS in Texas.
This BBS has forwarding with 15 BBS in North America and also with 15 BBS
outside the USA/CANADA. THIS BBS IS NEVER THE FIRST FORWARDER because
it has no users. (I run a separate BBS for the Houston area users.)
According to the present FCC rules, it cannot be responsible for bad messages.
The message has been written by somebody with an usurpated callsign.
Rejecting this callsign is not a solution.

For your information, the BBS handles more than 1000 messages per day.
The total daily traffic is around 10 Megabytes. Most of the messages are
forwarded within 15mn.

I think I do. It's really very simple; if the protocol does not hide the user data but merely authenticates it, then it is legal under Part 97 even if the authentication is based on strong cryptographic techniques. No rule changes or waivers should be required.

I think this is true even if the authentication cannot be verified by a third party who does not know the shared secret key. This is admittedly a disadvantage of using a keyed one-way hash function in the way I've described. But I think it's more than offset by the considerably improved performance as compared with RSA signing each and every packet (which could be verified by anyone with the corresponding public key).

|> backoff algorithms. It doesn't work right unless *everyone* on
|> the channel sets their parameters properly, and hidden terminals
|> still plague the system on non-repeated channels.

This may decrease the chances of collisions, but it doesn't really "avoid" them.

Check out the "MACA" scheme I wrote up for the ARRL CNC in 1990 (London Ont):

ftp://ftp.ucsd.edu/hamradio/packet/arrlcnc/1990/maca.ms.Z (troff -ms)
ftp://ftp.ucsd.edu/hamradio/packet/arrlcnc/1990/maca.ps.z (postscript)

It describes a protocol that really does avoid most collisions in the presence of hidden terminals, at least on data packets. Collisions can still occur on the packets that the protocol uses to contend for the channel, but since these packets are relatively small the throughput impairment should be less. Also, the performance of MACA depends on the capture behavior of the modulation method.

Hi, John from Canberra - Australia here.
requesting information on mods available for the above radio to allow
its use for packet (4800bd and above). Have installed some mods and
transmit seems O.K. at 4800, but reception seems very dependent on
the transmitting station. Have tapped after the demod circuit having
changed the first filter to a higher cut-off frequency. Still have
to de-tune the input to the demod substantially to get good decode.
This means radio becomes more deaf to distant stations, so I could
step on them.
So--- if you have a mod, please let me know - would also like to get
a copy of the service manual for this rig if anyone has.

Nope, because AX.25, by it's very nature, is not used for one-
way communications. Oh yes, you might say, it COULD be
(there are UI frames!), but it's not.

So again someone is looking at the wrong portion of the rules.

These are not one-way communications we are dealing with.

Yeah, yeah, yeah ... you and grumpy old W0RLI seem intent on reminding
the net of your 100 zillion message a year service. Many of the readers
here are doing the exact same thing. Don't pat a hole in your back.

Yes, you are the first forwarder in the United States.

Yes, you should trap message with bad language.

YES, YOU DO HAVE A RESPONSIBILITY TO AMATEUR RADIO.

Irregardless of what the FCC Part 97 says, it is trivial to stop this
from happening. Like Hank said, if your software doesn't do what you
need it to do, change software. What software are you running? Can you
trap bad language?

What you are saying above is that you have no intention of doing anything.
We can expect further problems. How many times do you think it will take
before the FCC does codify "the first forwarder in the United States or
its possessions"?

But is is broadcasting none the less.

I think it was Todd Little that that quoted the definition of broadcasting.

From Part 97.3(a) ... (10) ... Broadcasting - Transmissions intended for
reception by the general public, either direct or relayed.

Clearly, a BBS phone port with a annonymous check-in allows the public access
to relayed transmissions. There are LOTS of phone ports that allow
anonymous check-ins.

So, originators of bulletins which are sent by any means to a BBS that has
a public phone port that are not about amateur radio would fall under
broadcasting.

Broadcasting does not require a one-way transmission. It would appear that
an ax.25 connection between two stations can still be use for broadcasting.

(Bet we are going to move on and say that a bulletin about quilting was
targeted solely at the amateur population. Let me guess ... ANY bulletin
entered on packet is to be assumed to be aimed solely at the amateur radio
population.)

> these are ignored.
>
> Has anyone found a workable solution to this? NOS will quite happily
> forward to the FBB machine but it seems not the other way around.
>

I ran a set-up just like this for a long while. What I had to do to get
the two stations (w/ same callsign's) to talk to each other was to
actually "trick" FBB into thinking it was forwarding to something else.
For example, since you have the NOS side forwarding to FBB don't touch
a thing w/ its setup.
But, in the FBB FORWARD.SYS file the setup for the NOS station might
look like this:

```
A NOS
P A
C C SWITCH
C C KC4WYA-5
! B KC4WYA
B KC4WYA-5
! F KC4WYA
F xxx4xxx
F xxx4xxx
! H KC4WYA.NC.USA.NA
H KC4WYA-5.NC.USA.NA
G *
Z *
-------------
```

Also in the BBS.SYS file you will want to list the NOS station as what
ever you decided to place on the "A" line ... in this case it would be
"NOS" instead of the callsign of the NOS BBS.

I think that's the trick ... It makes FBB think that it isn't really
forwarding to the same callsign, but a callsign named "NOS", it doesn't
pay any attention to what the callsign it is connected to.

Try it out and let me know how it works for you ...

Good Luck! 73,
chris@rbdc.rbdc.com

There are some options that are free. S/KEY - a one time password system - is
available via anonymous FTP from thumper.bellcore.com:/pub/skey. Here's
a short (and out of date) description of S/KEY.

Description of The S/KEY One-Time Password System

Neil M. Haller nmh@thumper.bellcore.com
Philip R. Karn karn@chicago.qualcomm.com

ABSTRACT

The S/KEY one-time password system provides authentication over networks
that are subject to eavesdropping/reply attacks. This system has several
advantages compared with other one-time or multi-use authentication
systems. The user's secret password never crosses the network during
login, or when executing other commands requiring authentication such as
the UNIX passwd or su commands. No secret information is stored anywhere,
including the host being protected, and the underlying algorithm may be
(and it fact, is) public knowledge. The remote end of this system can run
on any locally available computer. The host end could be integrated into
any application requiring authentication.

Trademarks

Athena and Kerberos of trademarks of MIT.
S/KEY is a trademark of Bellcore.
SPX and DEC are trademarks of Digital Equipment Company.
UNIX is a registered trademark of UNIX System Laboratories, Inc.

Attributes of the S/KEY One-Time Password System

The S/KEY authentication system is a simple scheme that protects user
passwords against passive attacks. It is not as powerful or general in

scope as Kerberos or SDASS; nor does it protect against active attacks. It can, however, be easily and quickly added to almost any UNIX system without requiring any additional hardware and without requiring the system to store information (such as plain text passwords) that would be more sensitive than the encrypted passwords already stored. The S/KEY system can be used with non programmable terminals or personal computers (e.g., systems running DOS or Apple Macintoshes) with conventional communications programs.

Some of the properties of the S/KEY system are:

o Eavesdropping protection

o Conceptually simple and easy to use

o Based on a memorized secret password; does not require a special device although it can easily be adapted to do so.

o Can be automated for authentication from a trusted system. (Can also be partially automated for fast operation.)

o No secret algorithms.

o No secrets stored on host.

Description of the S/KEY One-Time Password System

There are two sides to the operation of our one-time password system. On the user (or client) side, the appropriate one-time password must be generated. On the system (server) side, the one-time password must be verified. One time passwords are generated and verified using a one-way function based on MD4 [Rivest]. (Conversion to MD5 would be trivial)

We have defined our one-way function to take 8 bytes of input and to produce 8 bytes of output. This is done by running the 8 bytes of input through MD4 and then "folding" pairs of bytes in the 16-byte MD4 output down to 8 bytes with exclusive-OR operations. This allows us to apply the one-way function an arbitrary number of times.

Generation of One-Time Passwords

The sequence of one-time passwords is produced by applying the one-way function multiple times. That is, the first one-way password is produced by running the user's secret password (s) through the one-way function some specified number of times, (n). Assuming n=4,

p(1) = f(f(f(f(s))))

The next one-way password is generated by running the user's password through the one-way function only n-1 times.

p(2) = f(f(f(s)))

An eavesdropper who has monitored the use of the one-time password p(i) will not be able to generate the next one in the sequence p(i+1) because doing so would require inverting the one-way function. Without knowing the secret key that was the starting point of the function iterations, this can not be done.

Seeding the Password

A user might want to use the same secret password on several machines, or might allow the iteration count to go to zero. An initial step concatenates a seed with the arbitrary length secret password, crunches the result with MD4, and folds the result to 64 bits. The result of this process is then iterated n times.

System Verification of Passwords

The host computer first saves a copy of the one-time password it receives, then it applies the one-way function to it. If the result does not match the copy stored in the system's password file, then the request fails. If they match, then the user's entry in the system password file is updated with the copy of the one-time password that was saved before the final execution (by the server) of the one-way function. This updating advances the password sequence.

Because the number of one-way function iterations executed by the user decreases by one each time, at some point the user must reinitialize the system or be unable to log in again. This is done by executing a special version of the passwd command to start a new sequence of one-time passwords. This operation is essentially identical to a normal authentication, except that the one-time password receive over the network is not checked against the entry already in the password file before it replaces it. In this way, the selection of a new password can be done safely even in the presence of an eavesdropper.

Operation of S/KEY One-Time Password System

Overview

The S/KEY one-time password authentication system uses computation to generate a finite sequence of single-use passwords from a single secret. The security is entirely based on a single secret that is known only to the user. Alternatively, part of or the entire secret can be stored in a non-retrievable way, in the computing device.

Generation of S/KEY One-Time Passwords

As mentioned above, the one-time password sequence is derived from the secret password using a computer. The required computation has been executed on a variety of PC and UNIX class machines including notebook and palm-tops. A vendor has estimated that credit card size devices could be built for less than $30 in large quantities.

The program can also be stored on and executed from a standard floppy disk. This would allow operation on a remote computer that could not be

entirely trusted not to contain a Trojan Horse that would attempt to capture the secret password. It is sometimes useful to pre-compute and print several one-time passwords. These could be carried on a trip where public terminals or workstations were available, but no trusted local computation was available.

Description of Operation

The following narrative describes the procedure for logging into a UNIX system using the S/KEY one-time password system. To illustrate the most complex case, we assume a hand-held PC compatible computer is used.

o The user, call her Sue, identifies herself to the system by login name.

o The system issues a challenge including the sequence number of the one-time password expected and a "seed" that is unique to the system. This "seed" allows Sue to securely use a single secret for several machines. Here the seed is "unix3" and the sequence number is 54.

o Sue enters 54 and unix3 into her palm-top computer. She is prompted for her secret password.

o Sue enters her secret password that may be of any length. The palm-top computes the 54th one-time password and displays it.

o Sue enters the one-time password and is authenticated.

o Next time Sue wants access, she will be prompted for one-time password sequence number 53.

Semi-Automated Operation

The complexity illustrated above is necessary only when using a terminal that is not programmable by the user, or when using a non-trusted terminal. We have built semi-automatic interfaces for clients using communications software on popular personal computers. The following example illustrates logging in using a trusted personal computer and a popular terminal emulation program.

o Before starting the communication program, Sue runs the CTKEY program that ties a TSR to a "hot-key" such as F10.

o Sue identifies herself by login name as above.

o The system issues the same challenge including the seed "unix3" and the sequence number 54. The host system now expects an s/key one-time password.

o Sue presses the hot-key and is then prompted for a secret password by the TSR program on the local system.

o In response to Sue's secret password, the 54th one-time password is displayed at the position of the cursor.

o Sue presses "Insert" and the terminal emulator transmits the one-time password completing the authentication.

If the personal computer were in a trusted location, an option of the CTKEY program allows the secret password to be stored in a local file.

Form of Password

Internally the one-time password is a 64 bit number. Entering a 64 bit number is not a pleasant task. The one-time password is therefore converted to a sequence of six short words (1 to 4 letters). Each word is chosen from a dictionary of 2048 words. The contents of this dictionary is not a secret.

Source Screening

It is frequently desirable to allow internal access with a multi-use password while requiring one-time passwords for external access. A screening table provides this function. When this table is present, login attempts that pass the screening test are permitted to use the normal password or a one-time password. Others are notified that the use of the one-time password is required.

Password echo

Normally systems disable printing during the typing of a password so that an onlooker cannot steal the password. With a one-time password, this is unnecessary. The replacement login command allows the user to turn echo on by pressing "return" at the password prompt. This makes it easier to enter the longer one-time password.

Acknowledgments

The idea behind our system was originally described by Leslie Lamport. Some details of the design were contributed by John S. Walden who wrote the initial version of the client software.

So, how do you discriminate between human-generated "bad words" (ROTFL)
and machine-generated sequences of the exact same bit pattern?

Thanks for the feedback. I would like to follow up and get product info.
from Wood and Douglas. Can you provide contact info? Email address would
be nice.

In looking at MX*COMs info, the approach isn't really to complicated.
Take three high performance op amps, have one be the input buffer from
the modem with it's output driving the other two; each independently
drives one point of modulation. Each 2nd stage op. amp. has it's own
gain adjust, so you then have to find the sweet spot. Nice theory, now
we have to turn it into a MOD file for the masses. (Or just me, for that
matter.. <grin>)

The two point modulation technique is used in the high speed version of
the 144PK Data Radio produced by Wood & Douglas in the UK (144PKD). The
technique involves frequency modulation both of the loop oscillator (as
normal) and also the reference oscillator, and appears to work very well.
As I remember, the only slightly tricky part of setting it up is
balancing the mod voltage to the varicap modulating the ref. oscillator
with the mod voltage sent to the loop oscillator.

I think this implementation is exacly what 'RUH (James Miller) is talking
about, since the 144PKD was designed by W&D in conjunction with him.

Disclaimer: Although I do work for W&D, I am not speaking on behalf of
the company and have had little direct involvement with the 144PK project.

Hi,

I'm looking about mods for the tr-9130, a 2m allmode trx, most wanted are
mods to connect a 9k6/FSK modem (g3ruh/k9ng type).
Maybe someone knows the equivalent 70cm type of this thing, it's more likely
that mods for 70cm exists.

Thanks and 73,
Olaf

Message-ID: <2639@vk2yqa.ampr.org>
Source record: 46700

Gidday all,

I am asking this on behalf of our local FBB sysop.

We want to interface a JNOS and FBB box for the different users in our area. Normally this works fine but we need to have the SAME callsign on both machines to conform to our license.

I understand that FBB absolutely refuses to forward to another machine if the 6 letter callsigns are the same. Even if the SSID's are different these are ignored.

Has anyone found a workable solution to this? NOS will quite happily forward to the FBB machine but it seems not the other way around.

I was thinking that NOS may be able to give itself another "callsign" (port specific) for use over the wire link and that FBB may have some remapping function (like NOS rewrite) of mail.

Anyone have any thoughts?

3925. digital radio protocol

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-02 12:09:55 UTC
From: vaughan@belltrans.co.nz
Message-ID: <397vik$143@news.midland.co.nz>
Source record: 46714

I'm currently working on a project that requires the transmission of data over a variably unreliable medium (mobile trunked radio, half duplex). To maximise efficency I'm fragmenting datagrams at the network layer to allow selective retransmsion. The problem that I am faced with is the long latency between asserting the Push to talk on the radio and the radio becoming ready to send data (~600 ms). To obtain maximun data transmssion rates, a protocol is required that inflicts the smallest number of transmit/recieve transitions. Does anybody know of a protocol that would be appropiate for this situation. I could (and have) arbitrarly invented a protocol, however it would be nice to use use some form of standard assuming any exsist.

Thanks in advance.

: use (i.e. how do I tune it for the 2M band) and use at 9k6 bps? All
: help will be greatly appreciated.
: 73, ka1njl

For our GE ExecII I use the following Tx modulation circuit at 9600bps:
(PacComm Tiny II Mark 2 TNC)

- Short out C8 in the PacComm TNC (it's on the main board).
- I use 174U coax between the TNC and radio. Connect a 1uf non-polar ceramic capacitor and a 10K resistor in series. Attach the resistor directly to the varactor diode in the channel element. Connect the coax center conductor to the capacitor. Ground the shield of the coax on the channel element.
- Set the PacComm modem to high audio level TX with the jumper

This ExecII has been in service for over a year now.

Has anyone played around with capacitors across the GE IF filters to widen the RX response? I had limited time last weekend and tried several values (3pf, 5pf, 30pf). All produced results that were worse than the stock receiver.

Good point Steve. Those that do "in your face" bragging about 10 megabytes throughput per day and about doing it "held harmless" ("Look Maw, I'm running a cheap common carrier!") seem to have a penchant for kicking sleeping dogs.

Lots of binary files apparently. Could any of those be copyright pictures or software? Even the internet anarchy can't hold off the U.S. copyright cops. I wonder how the amateur "forward only BBS's" will fare.

>For example a notice about the NY Cookie Eaters Assoc. meeting in
>Mrs Fields restaurant on 6th Avenue is a broadcast and is NG since
>it is not solely for ham use.

on the other hand if it was part of an announcement of where cookie eating hams can go to eat cookies it would be OK. and if it wasn't an "ad"...

and since the notice would be on the bbs under the "cookie" designator, those not wanting to know more about cookies wouldn't be bothered with it or by it.

another example...i believe the "keps" bulletins contain information about spacecraft other than just the OSCARs. don't have to have a ham license to receive weather fax so therefore that can't be directed at just hams, right? (talk about twisted logic...).

|>a reply, just like a CQ, except that it is not real-time. Any packet
|>message not intended to solicit a reply, and that does not relate
|>solely to ham use is a broadcast and is not permitted.

Not so. No where in Part 97 is the notion of "intent" for the content
of a message covered.

|>For example a notice about the NY Cookie Eaters Assoc. meeting in
|>Mrs Fields restaurant on 6th Avenue is a broadcast and is NG since
|>it is not solely for ham use.
|>
|>Notice about the Cookie Eaters Net on 40m is for ham use and is OK,
|>in my humble opinion. Also notice of the XYZ Amateur Radio Club
|>meeting in a restaurant on 6th avenue is also OK. This is similar
|>to W1AW one-way xmissions.

Wrong. The limitation on content needing to be related to amateur radio
is only for information bulletins which are an allowed form of one-way
communication.

Let's use your Cookie Eaters Net on 40m as an example. If I'm checked in
and state that "There is a cookie tasting contest at Mrs. Fields this
weekend". It is simply a statement I make to the members of the net. I'm
not expecting a reply, but that doesn't make it "one-way". I addressed it
to no specific station, but instead it was loosely directed to all the
stations on the net, but that doesn't make it broadcasting. A packet message
sent to COOKIE@ALLUSA making the same statement is the same thing. It just
doesn't occur in real time.

|>A message asking if there are any cookie nets on 40m or asking when
|>the next NY Cookie Eaters Assoc. meetings is is also ok since it
|>is soliciting a reply. This is like the start of any net, or a CQ,
|>or the "Are there any base stations to handle emergency traffic" call:
|>a one-way xmission soliciting a reply.

Every transmission does not need an explicit reply or acknowledgement to
be considered "two-way". No where in part 97 is that requirement made. If
it was, you couldn't make *any* statements. By your definition, you could
only ask questions and give responses. In fact, by your definition, every

contest exchange is one-way as I never explicitly ask for the exchange. Each station simply states their part of the exchange. (Also, packet would be one of a couple modes that would adhere to such a silly interpretation all the time since there is an explicit ack for each packet.) :-)

Another example is if I give the local whether conditions to another ham. He probably didn't ask for it, he probably will come back with a description of his station, so he didn't "acknowledge" it. So in your definition that is illegal because it wasn't requested, wasn't acknowledged, and it isn't amateur radio related? Puhleeze......

The real heart of the issue is "did two or more amateur radio stations transmit and recieve information?" If so, that certainly sounds like two-way communication to me.

Todd

This is kind of a plug on from an earlier author's message.

I saw an ad for MFJ's dataradio which is supposedly 9600 baud ready.
It's a standalone crystal controlled system. (one frequency at a time,
probably allows simplex/duplex with appropriate crystals.) any way
the long and short of this is that i am lookin to get into packet (and
120 for this radio does not seem like a bad price) and what ever speed
i choose to start at i would like to be able to go to 9600 at any time
i want.....

any comments on this radio please mail or post here

Well Steve, folks have been pointing out the error in your
understanding for some time now, but you appear to ignore
what they say. The digital BBS system does not use broadcasting,
all traffic is sent between two stations in QSO, and the
third party rules have been relaxed (starting with 85-105)
by the FCC to permit exactly the type of operation you claim
is "illegal". It is clear to anyone who has followed the
evolution of the digital BBS system (or to anyone willing
to LISTEN to those of us who have followed that evolution)
that the FCC has changed the rules in response to the desires
of the majority of the ham population.

Your claims of "illegal" operation are simply bogus.

Beating this dead horse does nothing to move ham radio
forward, but simply sows dissension and confusion.

Please read part 97, think about how the digital BBS network
actually works, and then contribute something positive to
the discussion. Basing your arguments on errors in understanding
of part 97 does nobody any good.

... Hank

Operating from memory, I don't think all TNC's DCD lines are that useful.
Think the DCD line on a TNC-2 is litterally the front panel CD light, and
not the (more useful) connection LED.

Throw the TNC into KISS-mode and WAMPES will let you do exactly what you
are asking for, and TCP/IP, multiple users, etc. I don't know what is
provided in the native AX.25 now available for Linux but I mean to find
out soon.

Seems that I once saw a modification for this, but I do not
remember at this point. I do know that the MFJ-1270 can be easily
modified for 19.2K operation all this takes away is 300 baud
operation.

One thing to note however, if TBAUD (have not tried this) will
not accept 19200 as a legal baud rate, all the mods in the
world are not going to change the firmware.

Note -> with the PK900 both 19200 and 38400 will work reliably.
This does require some VERY fast comm rountines to work
effectively (16550 UARTS may help) when using host mode
software.

|>broadcasting.

Good grief man, did you read what you posted? Because some station some
where along the message forwarding system allows the public access to the
messages certainly doesn't make it broadcasting by the above definition.
The orignator had no idea that the message forwarding station would allow
some land line user in. So he clearly couldn't have intended the general
public to recieve it. That is tantamount to saying that all phone
transmissions are broadcasting because some non-ham somewhere in the world
has a short wave radio. NOT! The message is simply third party traffic
as defined and allowed in Part 97.

Please *READ* the regulations.

|>Broadcasting does not require a one-way transmission. It would appear that
|>an ax.25 connection between two stations can still be use for broadcasting.

It can *NOT*! The general public can not engage in the necessary two-way
communication as they aren't licensed to do so. Stop trying to confuse
message forwarding systems with broadcasting. They are clearly defined in
Part 97.

Again, read the regulations instead of using your own perverted definitions.

73,
Todd

little@iamu.chi.dec.com (Todd Little) writes:

>Not so. No where in Part 97 is the notion of "intent" for the content
>of a message covered.

It would have been good if you had read the rules before making such a
statement:

97.3 Definitions.

(10) Broadcasting. Transmissions intended for reception by
^^^^^^^^
the general public, either direct or relayed.

97.113 Prohibited transmissions.

(4) Music using a phone emission except as specifically provided
elsewhere in this Section; Communications intended to facilitate a
^^^^^^^^
criminal act; Messages in codes or ciphers intended to obscure the meaning
^^^^^^^^
thereof, except as otherwise provided herein; Obscene or indecent words
or language; or false or deceptive messages, signals, or identification;

So you're wrong about that.... let's see what else you said:

>Wrong. The limitation on content needing to be related to amateur radio
>is only for information bulletins which are an allowed form of one-way
>communication.

BZZZZT. Strike two (I think - I'm not really sure what that sentence
tries to say, but if you are saying that the only one-way transmissions
allowed are information bulletins, then I stand by my BZZZZT):

97.111 Authorized transmissions.
(b) In addition to one-way transmissions specifically
authorized elsewhere in this Part, an amateur station may
transmit the following types of one-way communications:
(1) Brief transmissions necessary to make adjustments to the
station;
(2) Brief transmissions necessary to establishing two-way
communications with other stations;
(3) Transmissions necessary to remotely control a device
from a distant location;
(4) Transmissions necessary to providing emergency
communications;

(5) Transmissions necessary to assisting persons learning,
or improving proficiency in, the international Morse code; and
(6) Transmissions necessary to disseminate information
bulletins.

>Let's use your Cookie Eaters Net on 40m as an example. If I'm checked in

>stations on the net, but that doesn't make it broadcasting. A packet message
>sent to COOKIE@ALLUSA making the same statement is the same thing. It just
>doesn't occur in real time.

Wrong again. You say "to no specific station" and then you say
"directed to all the stations on the net" in the same breath. It
can't be both. Then you say a packet message is the same thing,
except that it's different. Wrong again - it can't be both.

>Every transmission does not need an explicit reply or acknowledgement to
>be considered "two-way". No where in part 97 is that requirement made.

Fast and loose with Part 97 again. Part 97 differentiates between
"one-way" and "two-way". If it's not one, then it's the other. That
is, one of the "ways" is transmitting, the other "way" is receiving. It
just differentiates between "broadcasting" and "conversing". A "one-way"
transmission is when you are sending a message (and not expecting to
engage into a conversation, I would suppose).

>Another example is if I give the local whether conditions to another ham.
>He probably didn't ask for it, he probably will come back with a
>description of his station, so he didn't "acknowledge" it. So in your
>definition that is illegal because it wasn't requested, wasn't acknowledged,
>and it isn't amateur radio related? Puhleeze......

You just went over the edge.

Two people having an interactive conversation about the weather, about
their hamshacks, is what ham radio is all about. A thousand computers
forwarding cookie recipes to ALL@USBBS is not what ham radio is about.
You know it, I know it, and this discussion has become astoundingly
boring and tedious, so while it may sadden a great many forward-
thinkers, I'm going to terminate my participation in it.

3947. Computer <--> Modem <--> Modem <--> TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-02 20:20:25 UTC
From: jeffo@syseng.slc.unisysgsg.com
Message-ID: <9411022020.AA12573@io.slc.unisysgsg.com>
Source record: 46731

`?

I have a couple questions about using modems to commuicate between computers that I hope somebody on the net can help me with.

Here is my problem. I have a ham radio TNC which runs on a RS-232 port (Figure 1).

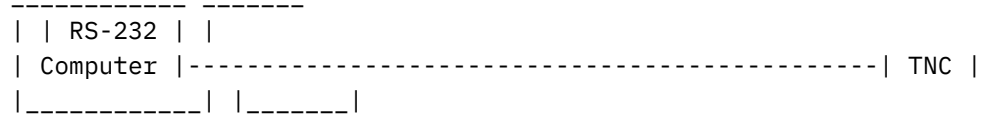

Figure 1

I have a new computer which does not have any free modem ports, but does have an internal modem. I have an extra stand alone modem and I was wondering if it is possible to use the modems so I can commuicate with my TNC (Figure 2).

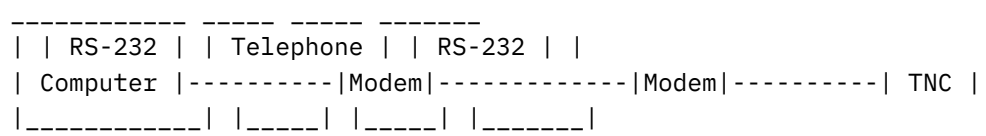

Figure 2

My second question is it possible to do the same thing in Figure 2 with two computers? A follow-on question is can I use my house's internal telephone wiring or do I need to run a direct link between the two modems?

Thank You

Jeff Okleberry

What SLOTTIME is being used by the 9600bd users ? When the SLOTTIME of
someone who is going to transmit a packet is smaller than the PTT-to-RF_OUT
